# Areas of Interest in PER

- ***Macro (program level)***
  - Historical evolution: what is taught, why it is taught;
  - *Learning goals*: concepts, scientific reasoning, problem-solving skills, experimentation skills, lab skills, etc.
- ***Meso (classroom level)***
  - Instructional methods
  - Logistical factors (group size and composition; class-size scaling, etc.)
  - Teacher preparation and assessment
- ***Micro (student level)***
  - Student ideas and knowledge structures; Learning behaviors
  - Assessment; Learning trajectories; Individual differences

# Some historical perspective

- The question of what subjects should be taught in schools and colleges, and how they should be taught, has occupied educators for centuries
- The rise and evolution of science education in the U.S. formed the basis for modern research in physics education
- So, let's dial back around one century...

# How Teach Science?

“...observation is an *active* process... [it] is exploration, inquiry for the sake of discovering something previously hidden and unknown...Pupils learn to observe for the sake...of ...inferring hypothetical explanations for the puzzling features that observation reveals; and...of testing the ideas thus suggested.

# How Teach Science?

“...observation is an *active* process... [it] is exploration, inquiry for the sake of discovering something previously hidden and unknown...Pupils learn to observe for the sake...of ...inferring hypothetical explanations for the puzzling features that observation reveals; and...of testing the ideas thus suggested.

“In short, observation becomes scientific in nature...For teacher or book to cram pupils with facts which, with little more trouble, they could discover by direct inquiry is to violate their intellectual integrity by cultivating mental servility.” [J. Dewey, *How We Think*, 1910; pp. 193-198]

# How Teach Science?

“...in teaching [a child] physics and chemistry, you must not be solicitous to fill him with information, but you must be careful that what he learns he knows of his own knowledge. Don't be satisfied with telling him that a magnet attracts iron. Let him see that it does; let him feel the pull of the one upon the other for himself.

# How Teach Science?

“...in teaching [a child] physics and chemistry, you must not be solicitous to fill him with information, but you must be careful that what he learns he knows of his own knowledge. Don't be satisfied with telling him that a magnet attracts iron. Let him see that it does; let him feel the pull of the one upon the other for himself. And, especially, tell him that it is his duty to doubt until he is compelled, by the absolute authority of Nature, to believe that which is written in books.”

[Thomas Huxley, *Science and Education*, 1893; p. 127.]

# How Teach Science?

“Science is organized knowledge; and before knowledge can be organized, some of it must first be possessed. Every study, therefore, should have a purely experimental introduction; and only after an ample fund of observations has been accumulated, should reasoning begin.

# How Teach Science?

“Science is organized knowledge; and before knowledge can be organized, some of it must first be possessed. Every study, therefore, should have a purely experimental introduction; and only after an ample fund of observations has been accumulated, should reasoning begin.

“...Children should be led to make their own investigations, and to draw their own inferences. They should be *told* as little as possible, and induced to *discover* as much as possible”

[Herbert Spencer, *Education: Intellectual, Moral, and Physical*, 1860; pp. 119-120.]

# What about the practical issues?

“...[In] the...method which begins with the experience of the learner and develops from that the proper modes of scientific treatment ...The apparent loss of time involved is more than made up for by the superior understanding and vital interest secured. What the pupil learns he at least understands.

# What about the practical issues?

“...[In] the...method which begins with the experience of the learner and develops from that the proper modes of scientific treatment ...The apparent loss of time involved is more than made up for by the superior understanding and vital interest secured. What the pupil learns he at least understands.

“...Students will not go so far, perhaps, in the ‘ground covered,’ but they will be sure and intelligent as far as they do go. And it is safe to say that the few who go on to be scientific experts will have a better preparation than if they had been swamped with a large mass of purely technical and symbolically stated information.” [J. Dewey, *Democracy and Education*, 1916; Chap. 17, Sec. 1]

# Physics Teaching in U.S. Schools

Nationwide surveys of high-school and college physics teachers in 1880\* and 1884\*\* revealed:

- Rapid expansion in use of laboratory instruction
- Strong support of “inductive method” of instruction in which experiment precedes explicit statement of principles and laws

\*F.W. Clarke, *A Report on the Teaching of Chemistry and Physics in the United States*, Circulars of Information No. 6, Bureau of Education (1880)

\*\*C.K. Wead, *Aims and Methods of the Teaching of Physics*, Circulars of Information No. 7, Bureau of Education (1884).

# First U.S. “Active-Learning” Physics Textbook:

Alfred P. Gage, *A Textbook of the Elements of Physics for High Schools and Academies* (Ginn, Boston, 1882).

*“The book which is the most conspicuous example now in the market of this inductive method is Gage's. Here, although the principles and laws are stated, the experiments have preceded them;*

**Virtually identical to the guiding principles of current research-based curricula**

A TEXT-BOOK

OR THE

# ELEMENTS OF PHYSICS

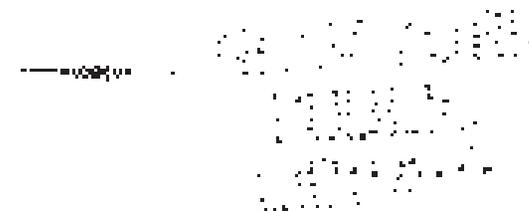

FOR

HIGH SCHOOLS AND ACADEMIES.

BY

ALFRED P. GAGE, A.M.

LECTURER IN PHYSICS IN THE MICHIGAN STATE NORMAL, EAST LANSING, MICH.

BOSTON:

PUBLISHED BY GINN, HEATH, & CO.

1882.

# Early Precursors of Modern Physics Pedagogy

- What happened when scientists first took on a prominent role in designing modern-day science education?

# A Chemist and a Physicist Examine Science Education

- In 1886, at the request of Harvard President Charles Eliot, physics professor Edwin Hall developed physics admissions requirements and created the “Harvard Descriptive List of Experiments.”
- In 1902, Hall teamed up with chemistry professor Alexander Smith (University of Chicago) to lay a foundation for rigorous science education. Together they published a 400-page book:

*“The Teaching of Chemistry and Physics in the Secondary School”* (A. Smith and E. H. Hall, 1902)

# Teaching Physics by Guided Inquiry: The Views of Edwin Hall

*“...It is hard to imagine any disposition of mind less scientific than that of one who undertakes an experiment knowing the result to be expected from it and prepared to work so long, and only so long, as may be necessary to attain this result...”*

# Teaching Physics by Guided Inquiry: The Views of Edwin Hall

*“...It is hard to imagine any disposition of mind less scientific than that of one who undertakes an experiment knowing the result to be expected from it and prepared to work so long, and only so long, as may be necessary to attain this result...I would keep the pupil just enough in the dark as to the probable outcome of his experiment, just enough in the attitude of discovery, to leave him unprejudiced in his observations, and then I would insist that his inferences...must agree with the record...of these observations...the experimenter should hold himself in the attitude of genuine inquiry.”* [from Smith and Hall, pp. 277-278]

# Teaching Physics by Guided Inquiry: The Views of Edwin Hall

*But why teach **physics**, in particular?*

# Teaching Physics by Guided Inquiry: The Views of Edwin Hall

*“...physics is peculiar among the natural sciences in presenting in its quantitative aspect a large number of perfectly definite, comparatively simple, problems, not beyond the understanding or physical capacity of young pupils. With such problems the method of discovery can be followed sincerely and profitably.”*

*[E.H. Hall, 1902]*

*[from Smith and Hall, p. 278]*

# Teaching Physics by the “Problem Method”: The Views of Robert Millikan

“...the material with which [physics] deals is almost wholly available to the student *at first hand*, so that in it he can be taught to observe, and to begin to interpret *for himself* the world in which he lives, instead of merely memorizing text-book facts, and someone else's formulations of so-called laws...the main object of the course in physics is to teach the student to *begin to think for himself*...

# Teaching Physics by the “Problem Method”: The Views of Robert Millikan

“...the material with which [physics] deals is almost wholly available to the student *at first hand*, so that in it he can be taught to observe, and to begin to interpret *for himself* the world in which he lives, instead of merely memorizing text-book facts, and someone else's formulations of so-called laws...the main object of the course in physics is to teach the student to *begin to think for himself*... the greatest need...is the kind of teaching which actually starts the pupil in the habit of independent thinking—which actually gets him to attempting to *relate*; that is, to *explain* phenomena in the light of the fundamental hypotheses and theories of physics.”

[R.A. Millikan, 1909]

[Sch. Sci. Math. **9**, 162-167]

## The “New Movement” for Physics Education Reform; ~ 1905-1915

- Reaction against overemphasis on formulaic approach, quantitative detail, precision measurement, and overly complex apparatus in laboratory-based high-school physics instruction
- Strong emphasis on qualitative understanding of fundamental physics “processes and principles underlying natural phenomena”

# Early Assessment of Students' Thinking

*“I have generally found very simple questioning to be sufficient to show the exceedingly vague ideas of the meaning of the results, both mathematical and experimental, of a large part of what is presented in the texts and laboratory manuals now in use.”*

# Early Assessment of Students' Thinking

*“I have generally found very simple questioning to be sufficient to show the exceedingly vague ideas of the meaning of the results, both mathematical and experimental, of a large part of what is presented in the texts and laboratory manuals now in use. Anxiety to secure the accurate results demanded in experimentation leads to the use of such complicated and delicate apparatus that the underlying principle is utterly lost sight of in the confusion resulting from the manipulation of the instrument.”*

*H.L. Terry, 1909*

*Wisconsin State Inspector of High Schools*

# Instructional Developments 1920-1950

- *At university level:* evolution of “traditional” system of lecture + “verification” labs
- *At high-school level:* Departure of [most] physicists from involvement with K-12 instruction; Evolution of textbooks with superficial coverage of large number of topics, terse and formulaic; heavy emphasis on detailed workings of machinery and technological devices used in “everyday life”
- *At K-8 level:* limited use of activities, few true investigations, “*teachers rarely ask a question because they are really curious to know what the pupils think or believe or have observed*” [Karplus, 1965]

# Research on Physics Learning

- *Earliest days:* In the 1920s, Piaget began a fifty-year-long investigation of children's ideas about the physical world; development of the "clinical interview"
- *1930s-1960s:* Most research occurred in U.S. and focused on analysis of K-12 instructional methods; scattered reports of investigations of K-12 students' ideas in physics (e.g., Oakes, *Children's Explanations of Natural Phenomena*, 1947)
- *Early 1960s:* "Rediscovery" of value of inquiry-based science teaching: Arons (1959); Bruner (1960); Schwab (1960, 1962)

# Instructional Developments in the 1950s

- *At university level:* development and wide dissemination of inservice programs for high-school teachers; Arnold Arons begins development of inquiry-based introductory college course (1959)
- *At high-school level:* Physical Science Study Committee (1956): massive, well-funded collaboration of leading physicists (Zacharias, Rabi, Bethe, Purcell, et al.) to develop and test new curricular materials; emphasis on deep conceptual understanding of broad principles; challenging lab investigations with very limited guidance; textbook, films, supplements, etc.
- *At K-8 level [around 1962]:* Proliferation of active-learning curricula (SCIS, ESS, etc.); Intense involvement by some leading physicists (e.g., Karplus, Morrison); *“Scientific information is obtained by the children through their own observations... the children are not told precisely what they are going to learn from their observations.”* [Karplus, 1965].

# Research on Students' Reasoning

- Karplus et al., 1960s-1970s: Carried out an extensive, painstaking investigation of K-12 students' abilities in proportional reasoning, control of variables, and other “formal reasoning” skills;
  - demonstrated age-related progressions;
  - revealed that large proportions of students lacked expected skills (See Fuller, ed. *A Love of Discovery*)
- Analogous investigations reported for college students (McKinnon and Renner, 1971; Renner and Lawson, 1973; Fuller et al., 1977)

# Beginning of Systematic Research on Students' Ideas in Physical Science: 1970s

- *K-12 Science*: Driver (1973) and Driver and Easley (1978) reviewed the literature and began to systemize work on K-12 students' ideas in science ["misconceptions," "alternative frameworks," etc]; only loosely tied to development of curriculum and instruction
- *University Physics*: In 1973, McDermott initiated detailed investigations of U.S. physics students' reasoning at the university level, incorporating and adapting the clinical-interview method; similar work was begun around the same time by Viennot and her collaborators in France (Viennot, 1976-1979; Trowbridge [thesis], 1979; Trowbridge and McDermott, 1980; also, H. Lin [MIT]).

## Initial Development of Research-based Curricula

- University of Washington, 1970s: initial development of *Physics by Inquiry* for use in college classrooms, inspired in part by Arons' *The Various Language* (1977): emphasis on development of physics concepts; “elicit, confront, and resolve” strategy
- Karplus and collaborators, 1975: development of modules for *Workshop on Physics Teaching and the Development of Reasoning*, directed at both high-school and college teachers: emphasis on development of [“Piagetian”] scientific reasoning skills and the “learning cycle” of guided inquiry.

# Areas of Interest in PER

- ***Macro (program level)***
  - Historical evolution: what is taught, why it is taught;
  - *Learning goals: concepts, scientific reasoning, problem-solving skills, experimentation skills, lab skills, etc.*
- ***Meso (classroom level)***
  - Instructional methods
  - Logistical factors K-20 (group size and composition; class-size scaling, etc.)
  - Teacher preparation and assessment
- ***Micro (student level)***
  - Student ideas, student difficulties; Learning behaviors
  - Assessment; Learning trajectories; Individual differences

# Effect of Physics Instruction on Development of Science Reasoning Skills

- Improvement of students' science-reasoning skills is a broad consensus goal of physics instructors everywhere
- Little (or no) published evidence to show improvements in reasoning due to physics instruction, traditional or “reformed”\*
- Bao et al. (2009) showed that good performance on FCI and BEMA not necessarily associated with improved performance on Lawson Test of Scientific Reasoning
- Various claims regarding improvements in reasoning skills of K-12 students from inquiry-based instruction (e.g., Adey and Shayer [1990-1993], Gerber et al. [2001] are not specifically in a physics context; studies have potentially confounding factors

\*However, Kozhevnikov and Thornton (2006) suggest improvements in spatial visualization ability

# Physics Problem-Solving Ability

- *The challenge:* Improve general problem-solving ability, and assess by disentangling it from conceptual understanding and mathematical skill
  - Develop general problem-solving strategies (Reif et al., 1982, 1995; Van Heuvelen, 1991; Heller et al., 1992)
  - Expert-novice studies: Larkin (1981)
  - Review papers: Maloney (1993); Hsu et al. (2004)
- Improvement in physics problem-solving skills has been demonstrated, but disentanglement is still largely an unsolved problem. (How much of improvement is due to better conceptual understanding, etc.?)

# Physics Process Skills

- *The challenge:* Assessing complex behaviors in a broad range of contexts, in a consistent and reliable manner
  - design, execution, and analysis of controlled experiments; development and testing of hypotheses, etc.
  - Assessment using qualitative rubrics; examination of trajectories and context dependence (Etkina et al., 2006-2008)

# Areas of Interest in PER

- ***Macro (program level)***
  - Historical evolution: what is taught, why it is taught;
  - *Learning goals*: concepts, scientific reasoning, problem-solving skills, experimentation skills, lab skills, etc.
- ***Meso (classroom level)***
  - Instructional methods
  - Logistical factors K-20 (group size and composition; class-size scaling, etc.)
  - Teacher preparation and assessment
- ***Micro (student level)***
  - Student ideas and knowledge structures; Learning behaviors
  - Assessment; Learning trajectories; Individual differences

# Research and Practice

- Classroom implementation of education research results is accompanied by a myriad of population and context variables
- Simultaneous quest for:
  - broadly generalizeable results that may be applied anywhere at any time
  - narrowly engineered implementations to optimize a particular instructional environment

# Issues with Research-Based Instruction

- Instruction informed and guided by research on students' thinking
  - *Need to know students' specific reasoning patterns, and extent of difficulties in diverse populations*
  - *Specific strategies must be formulated, and effectiveness assessed with specific populations*
- Students encouraged to express their reasoning, with rapid feedback
  - *Cost-benefit analysis to address logistical challenges*
- Emphasis on qualitative reasoning
  - *Balance with possible trade-offs in quantitative reasoning ability*

# Retention of Learning Gains

- *The challenge:* carry out longitudinal studies to document students' knowledge long after (~ years) instruction is completed
  - Above-average FCI scores retained 1-3 yrs after UW tutorial instruction (Francis et al., 1998)
  - Above-average gains from *Physics by Inquiry* curriculum retained one year after course (McDermott et al., 2000)
  - Improved scores on BEMA *after* junior-level E&M for students whose freshman course used UW tutorials (Pollock, 2009)
  - Higher absolute scores (although same loss rate) 0.5-2 yrs after instruction with *Matter and Interactions* curriculum (Kohlmeyer et al., 2009)

# Areas of Interest in PER

- ***Macro (program level)***
  - Historical evolution: what is taught, why it is taught;
  - *Learning goals*: concepts, scientific reasoning, problem-solving skills, experimentation skills, lab skills, etc.
- ***Meso (classroom level)***
  - Instructional methods
  - Logistical factors K-20 (group size and composition; class-size scaling, etc.)
  - Teacher preparation and assessment
- ***Micro (student level)***
  - Student ideas and knowledge structures; Learning behaviors
  - Assessment; Learning trajectories; Individual differences

# Descriptions of Students' Ideas

- Focus on specific difficulties, including links between conceptual and reasoning difficulties
  - (McDermott, 1991; 2001)
- Focus on diverse knowledge elements
  - “facets”: Minstrell, 1989, 1992
  - “phenomenological primitives”: diSessa, 1993
  - “resources”: Hammer, 2000

# Assessing and Strengthening Students' Knowledge Structures

- *The challenge:* students' patterns of association among diverse ideas in varied contexts are often unstable and unexpected, and far from those of experts; how can they be revealed, probed, and prodded in desired directions?
  - Emphasize development of hierarchical knowledge structures (Reif, 1995)
  - Stress problem-solving *strategies* to improve access to conceptual knowledge (Leonard et al., 1996)
  - Analyze shifts in students' knowledge structures (Bao et al., 2001; 2002; 2006; Savinainen and Viiri, 2008; Malone, 2008)

# Behaviors (and Attitudes) with Respect to Physics and Physics Learning

- The challenge: Assess complex behaviors, and potentially *more* complex relationships between those behaviors and learning of physics concepts and process skills
  - Behaviors (e.g., questioning and explanation patterns) linked to learning gains (Thornton, 2004)
  - Beliefs link to learning gains (May and Etkina, 2002)
  - Evolution of attitudes (VASS (Halloun and Hestenes, 1998); MPEX [Redish et al., 1998], EBAPS [Elby, 2001], CLASS [Adams et al., 2006], etc.)

## Learning Trajectories in Physics: Kinematics and Dynamics of Students' Thinking

- *The challenge:* How can we characterize the evolution of students' thinking? This includes:
  - sequence of knowledge elements and interconnections
  - sequence of difficulties, study methods, and attitudes
- Probes of student thinking must be repeated at many time points, and the effect of the probe itself taken into account

# Issues with Learning Trajectories

- Are there common patterns of variation in learning trajectories? If so, do they correlate with individual student characteristics?
- To what extent does the student's present set of ideas and difficulties determine the pattern of his or her thinking in the future?
  - Are there *well-defined* “transitional mental states” that characterize learning progress?
- To what extent can the observed sequences and patterns be altered as a result of actions by students and instructors?

# Learning Trajectories: Microscopic Analysis

- *The challenge:* Probe evolution of student thinking on short time scales (~ days-weeks) to examine relationship of reasoning patterns to instruction and other influences
  - Identification of possible “transition states” in learning trajectories (Thornton, 1997; Dykstra, 2002)
  - Revelation of micro-temporal dynamics, persistence/evanescence of specific ideas, triggers, possible interference patterns, etc. (Sayre and Heckler, 2009; Heckler and Sayre, 2010)

# Learning Trajectory: Upper-level and graduate courses

- The challenge: small samples, frequently diverse populations, significant course-to-course variations
  - Undergraduate: Ambrose (2003); Singh et al. (2005-2009)
  - Graduate: Patton (1996); Carr and McKagan (2009)

# Assessments

- The challenge: Develop valid and reliable probes of students' knowledge, along with appropriate metrics, that may be administered and evaluated efficiently on large scales
  - FCI (Halloun and Hestenes, 1985; Hestenes et al., 1992);
  - FMCE (Thornton and Sokoloff, 1998)
  - CSEM (Maloney et al., 2001)
  - Many others: see [www.ncsu.edu/PER/TestInfo.html](http://www.ncsu.edu/PER/TestInfo.html)
  - Normalized Gain metric: Hake, 1998
- Much work remains to be done...

# Summary

- Behold the expanding balloon effect: the more that is known, the greater is the extent of the frontier
- PER has (potentially) the capabilities and the resources to improve effectiveness of physics learning at all levels, K-20 and beyond
- Practical, classroom implementation of research findings with diverse populations has been a hallmark of PER from the beginning; it is a critical, and never-ending challenge
