SUMMARY

- We have administered written and online diagnostic tests covering topics in pre-college mathematics to over 7500 students enrolled in introductory physics courses at four state universities.
- Students' responses consistently reflected many operational errors, to a degree that could strongly impact students' course performance.
- Study of small selected subsamples shows consistently that students' pre-instruction math scores are predictive of their final course grades.
- Our findings have instructional implications that we have used to make modifications in our own instruction.
- In collaboration with Ohio State U., we are testing regular online homework exercises, with limited success in improving performance.

KEY FINDINGS AND INSTRUCTIONAL IMPLICATIONS

- Error rates of 30-60% appear consistently among all populations.

Implication: Instructors may need to adjust expectations of students' operational abilities with trigonometry, algebra, graphing, etc.
- Use of symbols to replace numbers in otherwise identical algebraic equations *significantly* lowered students' correct-response rate.

Implication: Instructors may choose to be much more cautious in using symbolic manipulation to explain or demonstrate concepts.
- Virtually no physics students tended to solve algebraic equations by "isolating the unknown variable"; semi-arithmetic methods were favored instead.

Implication: Physics instructors' standard and habitual approach to algebraic manipulation may appear foreign and confusing to their introductory students.
- Many students in both algebra- and calculus-based physics courses were extremely weak in handling units: they ignored units on graph-axis labels, and provided no or incorrect units for area and velocity.

Implication: Instructors may not fully appreciate the degree to which many physics students are challenged in handling units.
- Students' errors on specific topics are highly correlated with errors on other, disparate topics (trigonometry, geometry, graphing, algebra).

Implication: Student difficulties with a specific type of mathematical operation strongly implies existence of difficulties with *other* topics.
- Class-average scores on even a *single* diagnostic test item are highly predictive of average scores on other items covering varied topics.

Implication: It may be possible to diagnose the level of students' difficulties with only one or very few mathematics pretest items.
- Very high and very low pre-instruction math scores—on as few as three test items—are predictive of students' final course grades.

Implication: It may be possible to flag students at risk with short diagnostic math pre-tests.
- During interviews, students tended to self-correct approximately 60% of their initial errors, suggesting many errors are "careless."

Implication: Instruction on error-detecting, checking, and self-correcting strategies may offer disproportionately high returns in helping students address their mathematical difficulties.
- Regular online math-practice homework assignments may improve speed and/or accuracy, depending on the specific topic.

Implication: Interventions to address students' difficulties in long-practiced topics such as trigonometry and algebra may improve speed but not accuracy, while those targeted at more recently learned topics (such as vectors) may improve accuracy as well.

Algebra: Simultaneous Equations

Correct response rates ≈25% lower on "symbolic" versions.

$0.5y = 2x$
 $78.4 - y = 8x$
[Solve for x]
Numeric Version
79% correct
(N = 1043)

$cy = dx$
 $a - y = bx$
[Solve for x]
Symbolic Version
55% correct
(N = 862)

What is the slope of the graph below?

Correct-response rate (N > 2000):

30-60%, nearly independent of course or campus

(a) Area of the circle =

Area of Circle:
 ASU-Poly: 57% correct (N = 250)
 ASU-Tempe: 76% correct (N = 1086)

...with correct units: 29% and 45% correct, respectively

Trigonometry Problems:
 Algebra-based course: 20-55% correct

What is the value of θ ? #3

A. $\cos(3/6)$ B. $\sin(3/6)$ C. $\tan(3/6)$ D. $\cos^{-1}(3/6)$ E. $\sin^{-1}(3/6)$ F. $\tan^{-1}(3/6)$ G. 30° H. 45° I. 60° J. 27° K. $3/6$ L. 0.524

(There may be more than one correct answer, but please select only ONE answer.)

Performance on 3-item subset may approximately predict final course grade

In four classes studied, students who scored 3/3 on the pretest were, on average, twice as likely to get a B+ or higher final grade than those who scored 0/3 or 1/3.

$\frac{a/b}{c^2/d} = ?$ #11

A. $\frac{ac^2}{bd}$ B. $\frac{ad}{bc^2}$ C. $\frac{bd}{ac^2}$ D. $\frac{bc^2}{ad}$

(There may be more than one correct answer, but please select only ONE answer.)

Solve for x . #12

$\frac{3}{2} = 7x$

A. $\frac{14}{3}$ B. $\frac{3}{14}$ C. $\frac{21}{2}$ D. $\frac{21}{14}$

(There may be more than one correct answer, but please select only ONE answer.)
