# Outline

• Overview of goals and methods of PER

## Investigation of Students' Reasoning:

- Students' reasoning in thermodynamics
- Diverse representational modes in student learning

## Curriculum Development:

 Instructional methods and curricular materials for largeenrollment physics classes

## Assessment of Instruction:

- Measurement of learning gain
- Potential broader impact of PER on undergraduate education

## Goals of PER

- Improve effectiveness and efficiency of physics instruction
  - need to develop methods of measuring and assessing *learning* of physics (not merely *achievement*)
- Investigate obstacles that impede physics learning and develop instructional methods and materials to address them
- Critically assess and refine instructional innovations

## Methods of PER

- Develop conceptually "clean" diagnostic materials (i.e., well focused on specific concepts or tasks)
- Probe students' thinking through analysis of written and verbal explanations of their reasoning, supplemented by multiple-choice diagnostics
- Assess learning through measures derived from pre- and post-instruction testing

# What PER Can NOT Do

- Determine "philosophical" approach toward undergraduate education
  - focus on maximizing achievement of best-prepared students?
  - achieve significant learning gains for majority of enrolled students?
- Specify the goals of instruction in particular learning environments
  - physics concept knowledge
  - quantitative problem-solving ability

## Time Burden of Empirical Research

- Many variables (student demographics, instructor style, course logistics, etc.)
  - hard to identify
  - difficult to estimate relative importance
  - difficult (or impossible) to control
- ⇒ Fluctuations from one data run to next tend to be large

increases importance of replication

• Each data run requires entire semester

# Outline

• Overview of goals and methods of PER

## Investigation of Students' Reasoning:

- Students' reasoning in thermodynamics
- Diverse representational modes in student learning

## Curriculum Development:

 Instructional methods and curricular materials for largeenrollment physics classes

## Assessment of Instruction:

- Measurement of learning gain
- Potential broader impact of PER on undergraduate education

# Research Basis for Curriculum Development (NSF CCLI Project with T. Greenbowe)

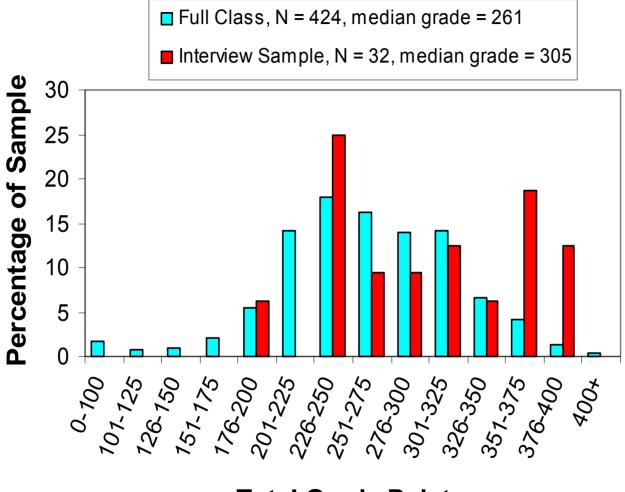

- To lay groundwork for curriculum development project, we undertook investigation of second-semester calculus-based general physics course populated mostly by engineering students (Phys 222).
- Written diagnostic questions administered last week of class in 1999, 2000, and 2001 (N<sub>total</sub> = 653).
- Detailed interviews (avg. duration ≥ one hour) carried out with 32 volunteers during 2002 (total class enrollment: 424).
  - interviews carried out after all thermodynamics instruction completed

#### [two course instructors, ~ 20 recitation instructors]

## Characterization of Interview Sample

- Represented 13 (out of 20 total) different recitation sections.
- 31 out of 32 had studied physics during high school.
- Final grades well above class average.

#### Grade Distributions: Interview Sample vs. Full Class

#### **Total Grade Points**

#### Interview Sample:

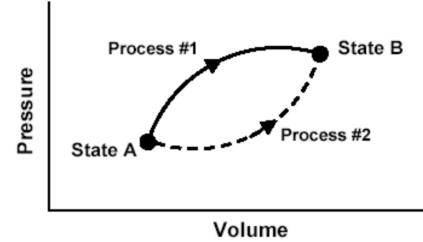

34% above 91<sup>st</sup> percentile; 50% above 81<sup>st</sup> percentile

# Predominant Themes of Students' Reasoning

- 1. Understanding of concept of state function in the context of energy.
- 2. Belief that work is a state function.
- 3. Belief that heat is a state function.
- 4. Belief that net work done and net heat absorbed by a system undergoing a cyclic process are zero.
- 5. Inability to apply the first law of thermodynamics.

# Understanding of Concept of State Function in the Context of Energy

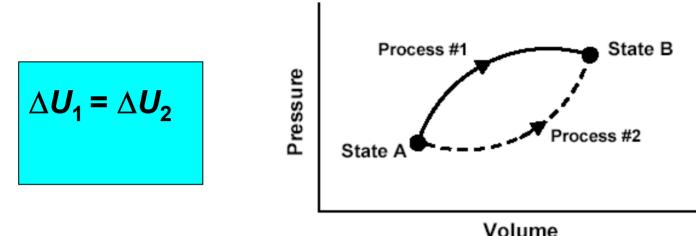

- Diagnostic question: two different processes connecting identical initial and final states.
- Do students realize that only initial and final states determine change in a state function?

[In these questions, *W* represents the work done *by* the system during a process; *Q* represents the heat *absorbed* by the system during a process.]

1. Is *W* for Process #1 *greater than, less than,* or *equal to* that for Process #2? Explain.

2. Is Q for Process #1 greater than, less than, or equal to that for Process #2?

[In these questions, *W* represents the work done *by* the system during a process; *Q* represents the heat *absorbed* by the system during a process.]

1. Is *W* for Process #1 *greater than, less than,* or *equal to* that for Process #2? Explain.

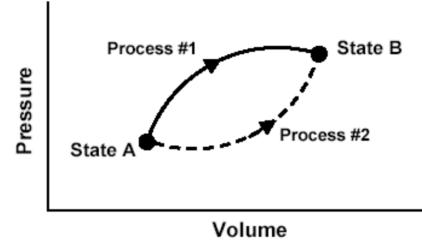

2. Is Q for Process #1 greater than, less than, or equal to that for Process #2?

# Students seem to have adequate grasp of state-function concept

- Consistently high percentage (70-90%) of correct responses on relevant questions.
- Large proportion of correct explanations.
- Interview subjects displayed good understanding of state-function idea.
- Students' major conceptual difficulties stemmed from overgeneralization of statefunction concept. Details to follow ....

# Predominant Themes of Students' Reasoning

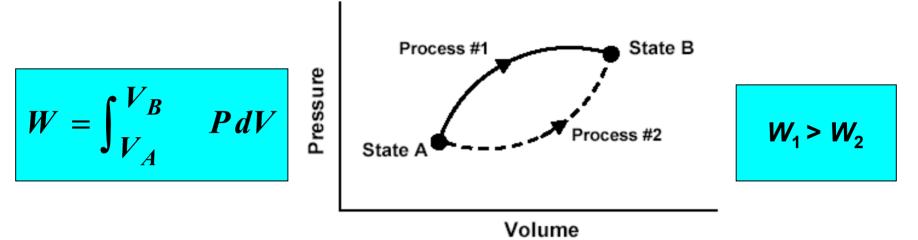

- 1. Understanding of concept of state function in the context of energy.
- 2. Belief that work is a state function.
- 3. Belief that heat is a state function.
- 4. Belief that net work done and net heat absorbed by a system undergoing a cyclic process are zero.
- 5. Inability to apply the first law of thermodynamics.

[In these questions, *W* represents the work done *by* the system during a process; *Q* represents the heat *absorbed* by the system during a process.]

1. Is *W* for Process #1 *greater than, less than,* or *equal to* that for Process #2? Explain.

2. Is Q for Process #1 greater than, less than, or equal to that for Process #2?

[In these questions, *W* represents the work done *by* the system during a process; *Q* represents the heat *absorbed* by the system during a process.]

1. Is *W* for Process #1 *greater than, less than,* or *equal to* that for Process #2? Explain.

2. Is Q for Process #1 greater than, less than, or equal to that for Process #2?

## Responses to Diagnostic Question #1 (Work question)

	<b>1999</b> ( <i>N</i> =186)	<b>2000</b> ( <i>N</i> =188)	2001 ( <i>N</i> =279)	<b>2002</b> Interview Sample ( <i>N</i> =32)
$W_1 = W_2$	25%	26%	35%	22%
Because work is independent of path	а	14%	23%	22%
Other reason, or none	а	12%	13%	0%

<sup>a</sup>explanations not required in 1999

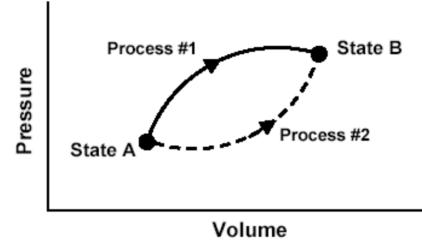

# Explanations Given by Interview Subjects to Justify $W_1 = W_2$

- "Work is a state function."
- "No matter what route you take to get to state B from A, it's still the same amount of work."
- "For work done take state A minus state B; the process to get there doesn't matter."

# Predominant Themes of Students' Reasoning

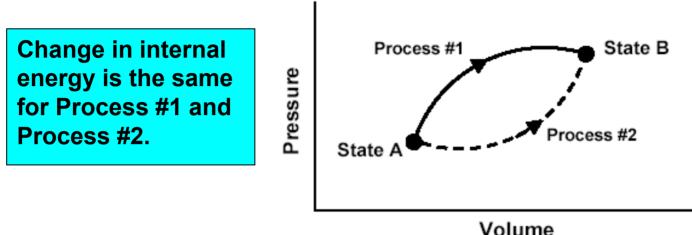

- 1. Understanding of concept of state function in the context of energy.
- 2. Belief that work is a state function.
- 3. Belief that heat is a state function.
- 4. Belief that net work done and net heat absorbed by a system undergoing a cyclic process are zero.

1. Is *W* for Process #1 *greater than, less than,* or *equal to* that for Process #2? Explain.

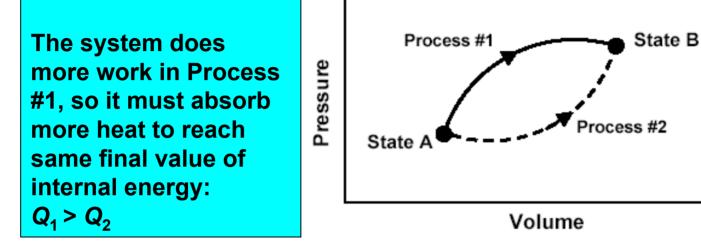

2. Is Q for Process #1 greater than, less than, or equal to that for Process #2?

## Responses to Diagnostic Question #2 (Heat question)

	<b>1999</b> ( <i>N</i> =186)	<b>2000</b> ( <i>N</i> =188)	2001 ( <i>N</i> =279)	<b>2002</b> Interview Sample ( <i>N</i> =32)
$Q_1 = Q_2$	31%	43%	41%	47%
Because heat is independent of path	21%	23%	20%	44%
Other explanation, or none	10%	18%	20%	3%

# Explanations Given by Interview Subjects to Justify $Q_1 = Q_2$

- "I believe that heat transfer is like energy in the fact that it is a state function and doesn't matter the path since they end at the same point."
- "Transfer of heat doesn't matter on the path you take."
- "They both end up at the same PV value so . . . They both have the same Q or heat transfer."
- Almost 200 students offered arguments similar to these either in their written responses or during the interviews.

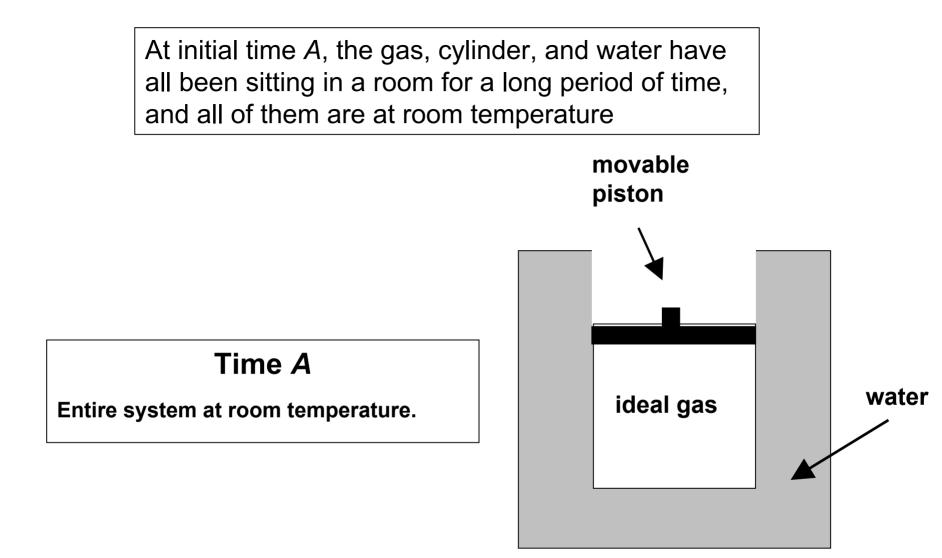

# Predominant Themes of Students' Reasoning

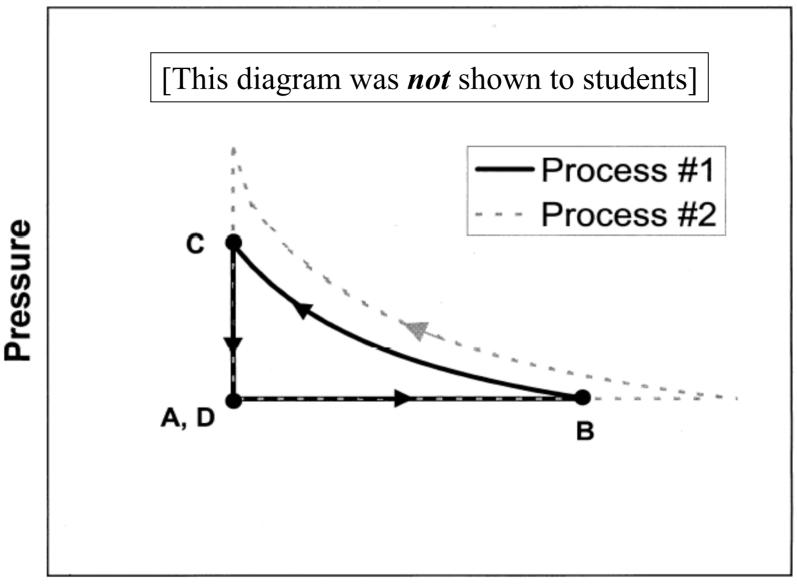

- 1. Understanding of concept of state function in the context of energy.
- 2. Belief that work is a state function.
- 3. Belief that heat is a state function.
- 4. Belief that net work done and net heat absorbed by a system undergoing a cyclic process are zero.
- 5. Inability to apply the first law of thermodynamics.

## **Interview Questions**

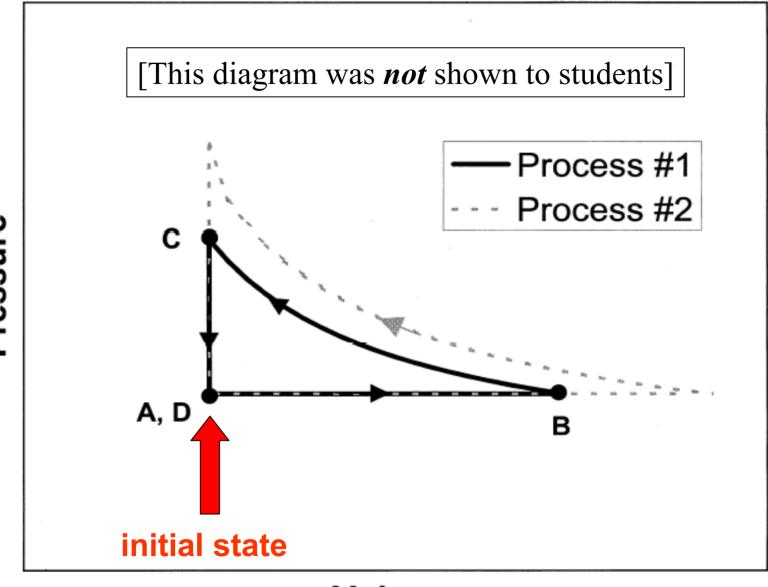

A fixed quantity of ideal gas is contained within a metal cylinder that is sealed with a movable, frictionless, insulating piston.

The cylinder is surrounded by a large container of water with high walls as shown. We are going to describe two separate processes, Process #1 and Process #2.

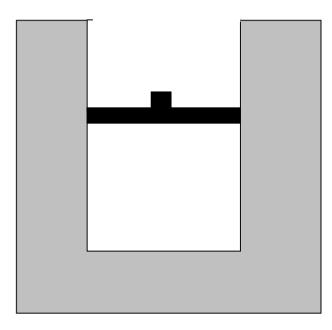

Volume

Volume

Pressure

**Step 1.** We now begin Process #1: The water container is gradually heated, and the piston *very slowly* moves upward. At time *B* the heating of the water stops, and the piston stops moving when it is in the position shown in the diagram below:

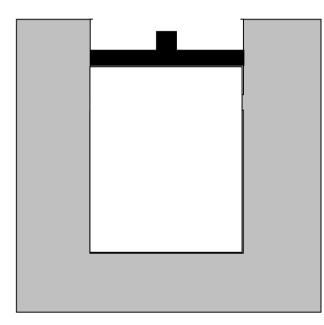

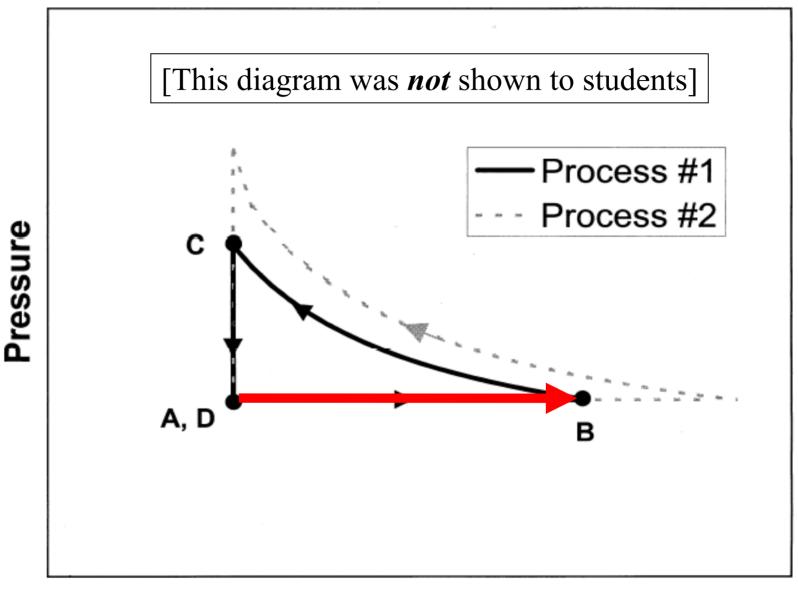

**Step 1.** We now begin Process #1: The water container is gradually heated, and the piston *very slowly* moves upward. At time *B* the heating of the water stops, and the piston stops moving when it is in the position shown in the diagram below:

#### Time B

Piston in new position.

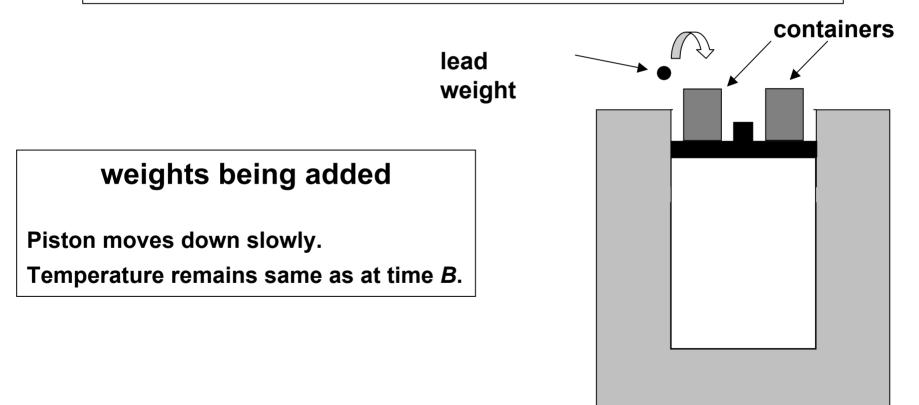

Temperature of system has changed.

Volume

**Step 2.** Now, empty containers are placed on top of the piston as shown. Small lead weights are gradually placed in the containers, one by one, and the piston is observed to move down slowly. While this happens, the temperature of the water is nearly unchanged, and the gas temperature remains practically *constant*. (That is, it remains at the temperature it reached at time *B*, after the water had been heated up.)

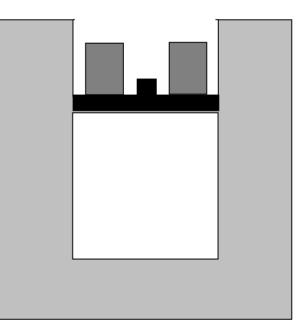

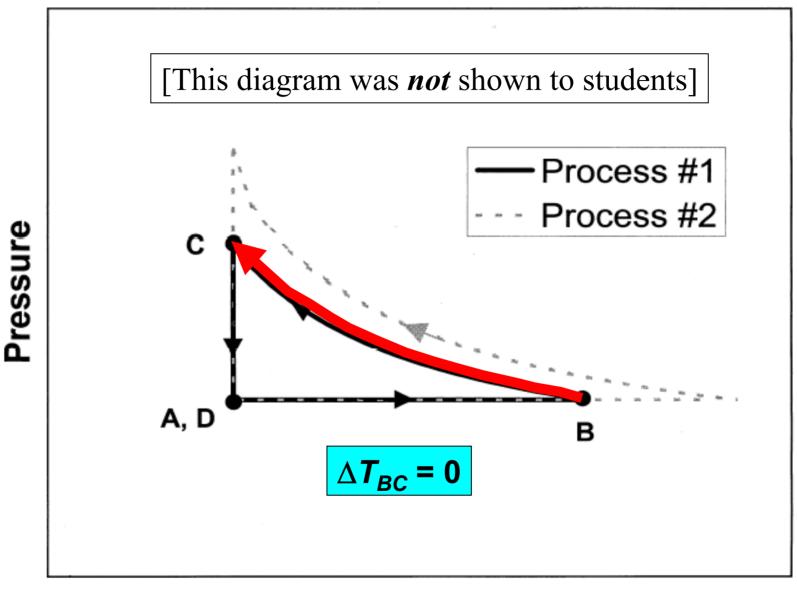

**Step 3.** At time *C* we stop adding lead weights to the container and the piston stops moving. (The weights that we have already added up until now are still in the containers.) The piston is now found to be at *exactly the same position it was at time* A.

#### Time C

Weights in containers. Piston in same position as at time *A*.

Temperature same as at time *B*.

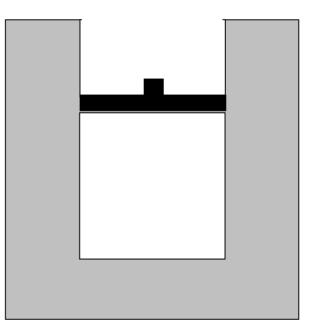

## Volume

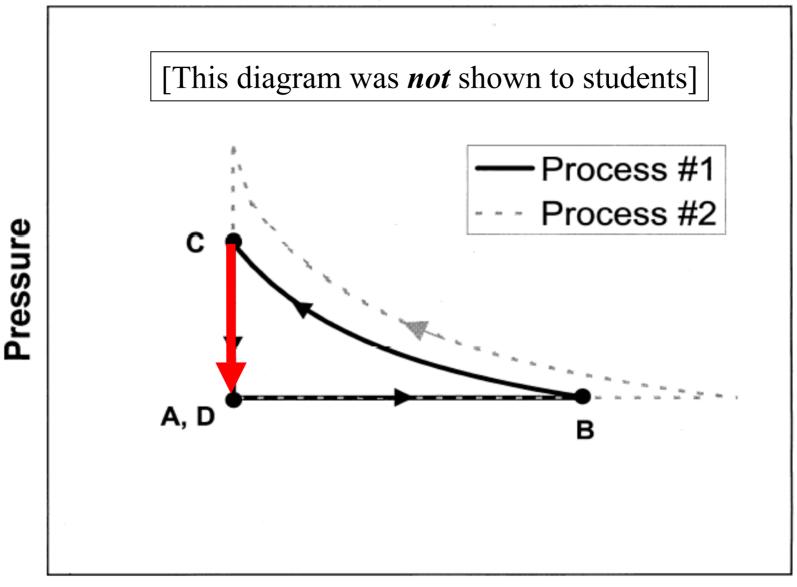

**Step 4.** Now, the piston is locked into place so it *cannot move*; the weights are removed from the piston. The system is left to sit in the room for many hours, and eventually the entire system cools back down to the same room temperature it had at time *A*. When this finally happens, it is time *D*.

#### Time D

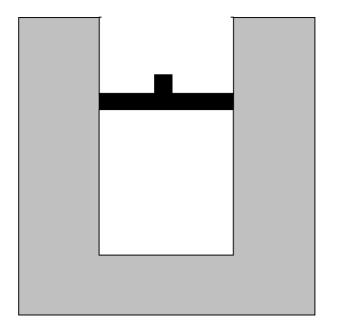

Piston in same position as at time *A*.

Temperature same as at time A.

## Volume

## Time D

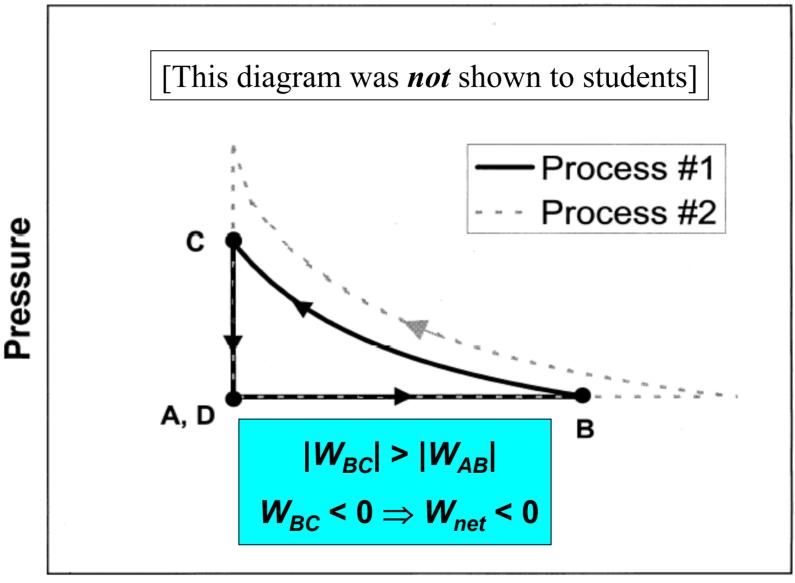

Piston in same position as at time *A*.

Temperature same as at time *A*.

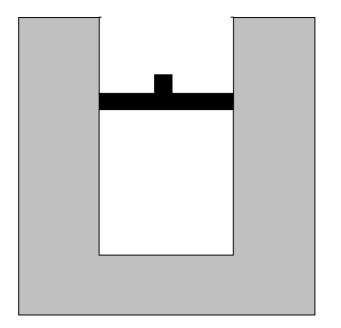

Question #6: Consider <u>the entire process</u> from time A to time D.

(*i*) Is the net work done *by* the gas on the environment during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

*(ii)* Is the total heat transfer to the gas during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

Volume

## Time D

Piston in same position as at time *A*.

Temperature same as at time *A*.

Question #6: Consider <u>the entire process</u> from time A to time D.

(*i*) Is the net work done *by* the gas on the environment during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

*(ii)* Is the total heat transfer to the gas during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

## Results on Interview Question #6 (i) N = 32

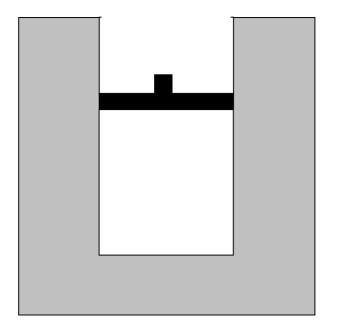

- (a) *W<sub>net</sub>* > 0 : 16%
- (b) *W<sub>net</sub>* = 0: 63%
- (c) *W<sub>net</sub>* < 0: 19% [correct]
  - No response: 3%

Even after being asked to draw a P-V diagram for Process #1, nearly two thirds of the interview sample believed that net work done was equal to zero.

# Explanations offered for $W_{net} = 0$

"[Student #1:] The physics definition of work is like force times distance. And basically if you use the same force and you just travel around in a circle and come back to your original spot, technically you did zero work."

"[Student #2:] At one point the volume increased and then the pressure increased, but it was returned back to that state . . . The piston went up so far and then it's returned back to its original position, retracing that exact same distance."

## Time D

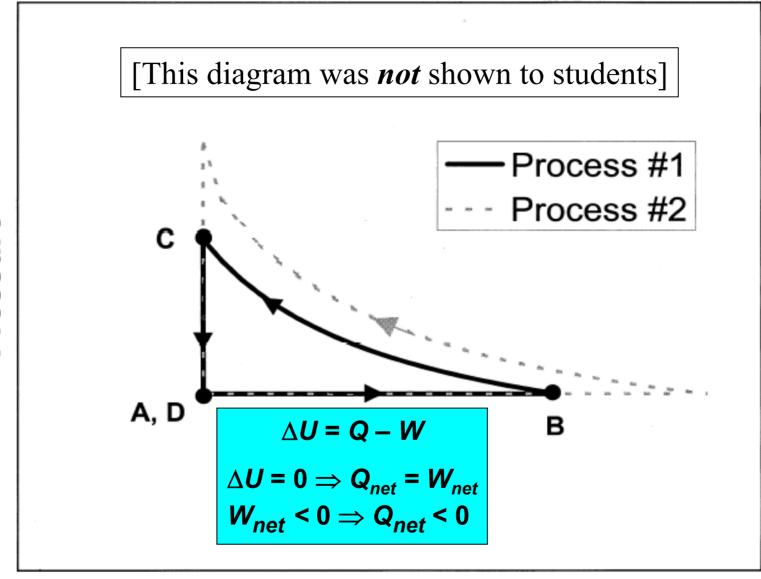

Piston in same position as at time *A*.

Temperature same as at time *A*.

#### Question #6: Consider <u>the entire process</u> from time A to time D.

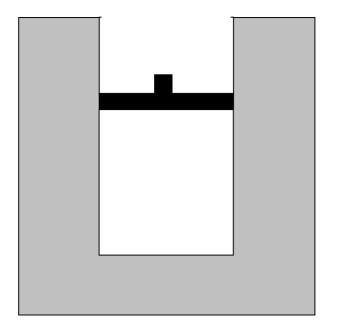

*(i)* Is the net work done *by* the gas on the environment during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

*(ii)* Is the total heat transfer to the gas during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

Volume

# Pressure

## Time D

Piston in same position as at time *A*.

Temperature same as at time *A*.

#### Question #6: Consider <u>the entire process</u> from time A to time D.

(*i*) Is the net work done *by* the gas on the environment during that process (a) greater than zero, (b) equal to zero, or (c) less than zero?

*(ii)* Is the total heat transfer to the gas during that process (a) greater than zero, (b) equal to zero, or **(c) less than zero**?

## Results on Interview Question #6 (ii) N = 32

- (a)  $Q_{net} > 0$  9%
- (b)  $Q_{net} = 0$  69%
- (c)  $Q_{net} < 0$  16% [correct]

with correct explanation: 13%

with incorrect explanation: 3%

Uncertain: 6%

More than two thirds of the interview sample believed that net heat absorbed was equal to zero.

# Explanations offered for $Q_{net} = 0$

"[Student #1] The net heat absorbed is going to be zero. . . Same initial position, volume, pressure, number of molecules, same temperature. So even if it did absorb and lose some during the process, the ending result is equal to zero."

"[Student #2] The heat transferred to the gas . . . is equal to zero . . . . The gas was heated up, but it still returned to its equilibrium temperature. So whatever energy was added to it was distributed back to the room."

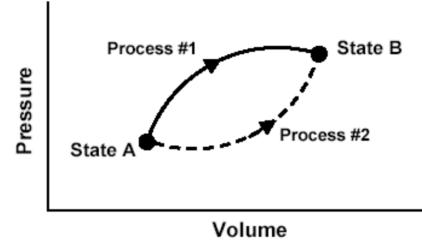

# Most students thought that both $Q_{net}$ and $W_{net}$ are equal to zero

- 56% believed that both the net work done
   and the total heat transferred would be zero.
- Only three out of 32 students (9%) answered both parts of Interview Question #6 correctly.

# Predominant Themes of Students' Reasoning

- 1. Understanding of concept of state function in the context of energy.
- 2. Belief that work is a state function.
- 3. Belief that heat is a state function.
- 4. Belief that net work done and net heat absorbed by a system undergoing a cyclic process are zero.
- 5. Inability to apply the first law of thermodynamics.

This *P-V* diagram represents a system consisting of a fixed amount of ideal gas that undergoes two *different* processes in going from state A to state B:

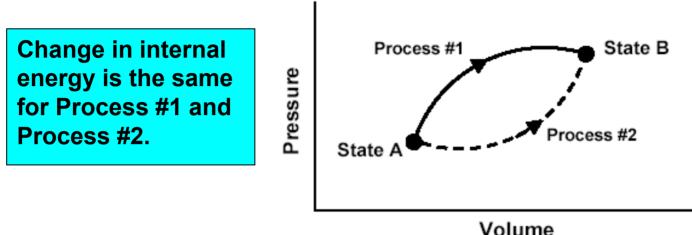

[In these questions, *W* represents the work done *by* the system during a process; *Q* represents the heat *absorbed* by the system during a process.]

1. Is *W* for Process #1 *greater than, less than,* or *equal to* that for Process #2? Explain.

2. Is Q for Process #1 greater than, less than, or equal to that for Process #2?

3. Which would produce the largest change in the total energy of all the atoms in the system: *Process #1, Process #2,* or *both processes produce the same change?* 

This *P-V* diagram represents a system consisting of a fixed amount of ideal gas that undergoes two *different* processes in going from state A to state B:

## Responses to Diagnostic Question #2 (Heat question)

	<b>1999</b> ( <i>N</i> =186)	<b>2000</b> ( <i>N</i> =188)	<b>2001</b> ( <i>N</i> =279)	2002 Interview Sample ( <i>N</i> =32)
Q <sub>1</sub> > Q <sub>2</sub> (disregarding explanations)	56%	40%	40%	34%

# Examples of "Acceptable" Student Explanations for $Q_1 > Q_2$

" $\Delta U = Q - W$ . For the same  $\Delta U$ , the system with more work done must have more Q input so process #1 is greater."

"Q is greater for process 1 since Q = U + W and W is greater for process 1."

"Q is greater for process one because it does more work; the energy to do this work comes from the  $Q_{in}$ ."

## Responses to Diagnostic Question #2 (Heat question)

	<b>1999</b> ( <i>N</i> =186)	<b>2000</b> ( <i>N</i> =188)	2001 ( <i>N</i> =279)	<b>2002</b> Interview Sample ( <i>N</i> =32)
Q <sub>1</sub> > Q <sub>2</sub>	56%	40%	40%	34%
Correct or partially correct explanation	14%	10%	10%	19%
Incorrect, or missing explanation	42%	30%	30%	15%

# Fewer than 20% of Students are Able to Apply First Law

- Fewer than 15% of students responding to written diagnostic questions could explain why  $Q_1 > Q_2$ .
- Fewer than 20% of students in interview sample could explain why  $Q_1 > Q_2$ .
- 13% of students in interview sample were able to use first law to correctly answer Question #6(ii).

Large majority of students finish general physics course unable to apply first law of thermodynamics.

Consistent with results of Loverude, Kautz, and Heron, Am. J. Phys. (2002), for Univ. Washington, Univ. Maryland, and Univ. Illinois

# Fewer than 20% of Students are Able to Apply First Law

- Fewer than 15% of students responding to written diagnostic questions could explain why  $Q_1 > Q_2$ .
- Fewer than 20% of students in interview sample could explain why  $Q_1 > Q_2$ .
- 13% of students in interview sample were able to use first law to correctly answer Question #6(ii).

Students very often attribute state-function properties to process-dependent quantities.

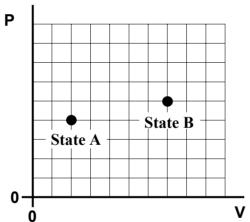

## Some Strategies for Instruction

- Try to build on students' understanding of statefunction concept.
- Focus on meaning of heat as *transfer* of energy, *not* quantity of energy residing in a system.
- Develop concept of work as energy transfer mechanism.

#### **Thermodynamics Worksheet**

For an ideal gas, the internal energy U is directly proportional to the temperature T. (This is because the internal energy is just the total kinetic energy of all of the gas molecules, and the temperature is defined to be equal to the *average* molecular kinetic energy.) For a monatomic ideal gas, the relationship is given by  $U = \frac{3}{2}nRT$ , where n is the number of moles of gas, and R is the universal gas constant.

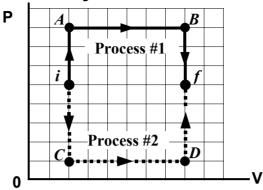

- 1. Find a relationship between the internal energy of n moles of ideal gas, and pressure and volume of the gas. Does the relationship change when the number of moles is varied?
- 2. Suppose that *m* moles of an ideal gas are contained inside a cylinder with a movable piston (so the volume can vary). At some initial time, the gas is in state *A* as shown on the *PV*-diagram in Figure 1. A thermodynamic process is carried out and the gas eventually ends up in State *B*. Is the internal energy of the gas in State *B greater than, less than,* or *equal to* its internal energy in State *A*? (That is, how does  $U_B$  compare to  $U_A$ ?) Explain.

3. If a system starts with an initial internal energy of  $U_{initial}$  and ends up with  $U_{final}$  some time later, we symbolize the *change* in the system's internal energy by  $\Delta U$  and define it as follows:  $\Delta U = U_{final} - U_{initial}$ .

- a. For the process described in #2 (where the system goes from State *A* to State *B*), is  $\Delta U$  for the gas system *greater than zero*, *equal to zero*, or *less than zero*?
- b. During this process, was there any energy transfer between the gas system and its surrounding environment? Explain.

#### **Thermodynamics Worksheet**

- 7. Rank the *temperature* of the gas at the six points *i*, *A*, *B*, *C*, *D*, and *f*. (Remember this is an *ideal* gas.)
- 8. Consider all sub-processes represented by straight-line segments. For each one, state whether the work is positive, negative, or zero. In the second column, rank all six processes according to their  $\Delta U$ . (Pay attention to the sign of  $\Delta U$ .) If two segments have the same  $\Delta U$ , give them the same rank. In the last column, state whether heat is added *to* the gas, taken *away* from the gas, or is *zero* (i.e., *no* heat transfer). *Hint:* First determine U for each point using the result of #1 on page 1.

Process	Is W+, -, or 0?	rank according to $\Delta U$	heat added to, taken away, or zero?
$i \rightarrow A$			
$A \rightarrow B$			
$B \rightarrow f$			
$i \rightarrow C$			
$C \rightarrow D$			
$D \rightarrow f$			

- 9. Consider **only** the sub-processes that have W = 0. Of these, which has the *greatest* absolute value of heat transfer *Q*? Which has the *smallest* absolute value of *Q*?
- 10. Rank the six segments in the table above according to the absolute value of their W. Hint: For processes at constant pressure,  $W = P \Delta V$ .
- 11. Using your answers to #8 and #10, explain whether  $W_1$  is greater than, less than, or equal to  $W_2$ . [Refer to definitions, page 3.] Is there also a way to answer this question using an "area" argument?
- 12. Is  $Q_1$  greater than, less than, or equal to  $Q_2$ ? Explain. *Hint:* Compare the magnitude of  $\Delta U_1$  and  $\Delta U_2$ , and make use of the answer to #6.

# Outline

• Overview of goals and methods of PER

## Investigation of Students' Reasoning:

- Students' reasoning in thermodynamics
- Diverse representational modes in student learning

## Curriculum Development:

 Instructional methods and curricular materials for largeenrollment physics classes

## Assessment of Instruction:

- Measurement of learning gain
- Potential broader impact of PER on undergraduate education

Investigation of Diverse Representational Modes in the Learning of Physics and Chemistry NSF ROLE, Co-PI: T. J. Greenbowe

- Probe students' reasoning with widely used representations
  - e.g., free-body, *P-V*, and field-vector diagrams
- Compare student reasoning with different forms of representation of same concept
  - e.g., verbal, diagrammatic, mathematical/symbolic, graphical
- Preliminary work: student understanding of vector concepts
  - central to instruction in general physics curriculum
  - no previous studies probed vectors in graphical context

# Physics Students' Understanding of Vector Concepts

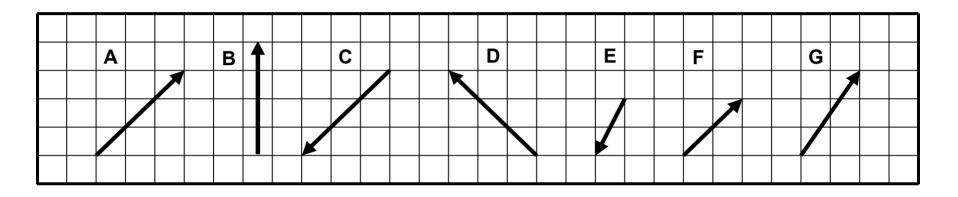

N. Nguyen and DEM, Am. J. Phys. (in press)

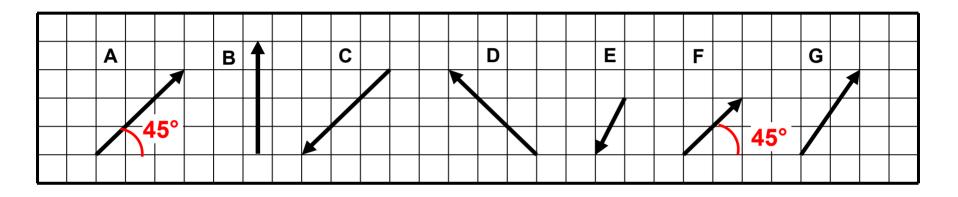

- Seven-item quiz administered in all ISU general physics courses during 2000-2001
- Quiz items focus on basic vector concepts posed in graphical form
- Given during first week of class; 2031 responses received
  - Algebra-based course:
     A-1, N = 520; A-2, N = 201
  - Calculus-based course:
     C-1, N = 608; C-2, N = 702

 A-1: First semester, algebra-based course
 A-2: Second semester, algebra-based course etc.

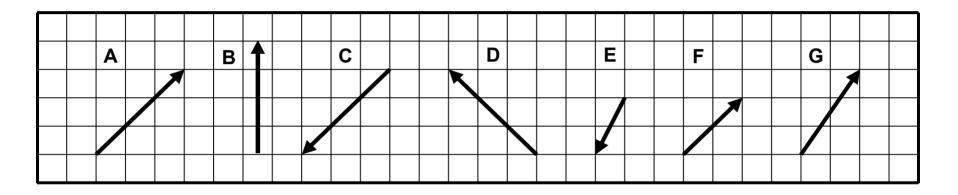

# Two Key Items

- Question #2: Choose vector with same direction as given vector
- **Question #5:** Two-dimensional vector addition

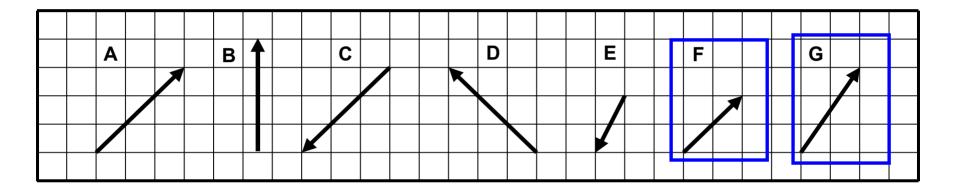

Direction of  $\mathbf{F}$  is same as direction of  $\mathbf{A}$ 

Error Rates (incorrect responses):

C-2: 23% C-1: 29%

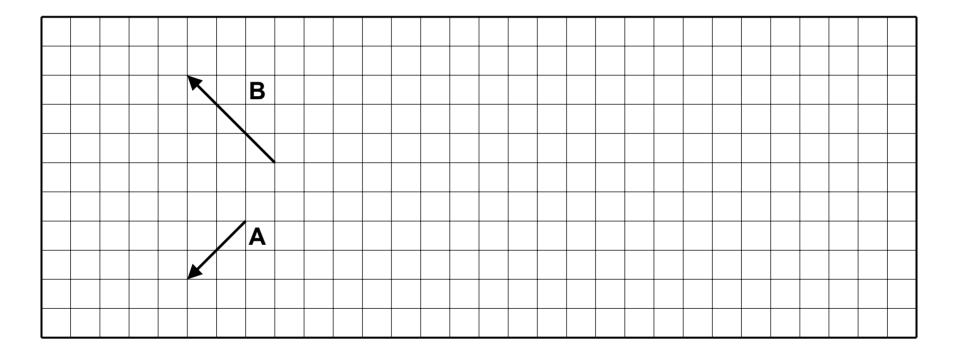

A-2: 37% A-1: 45%

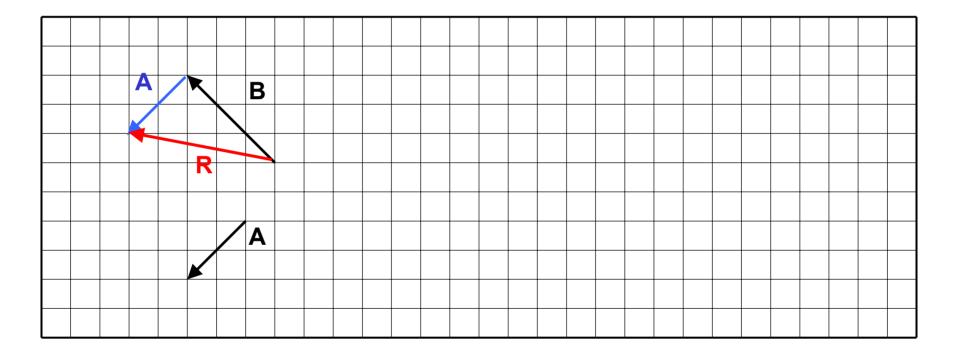

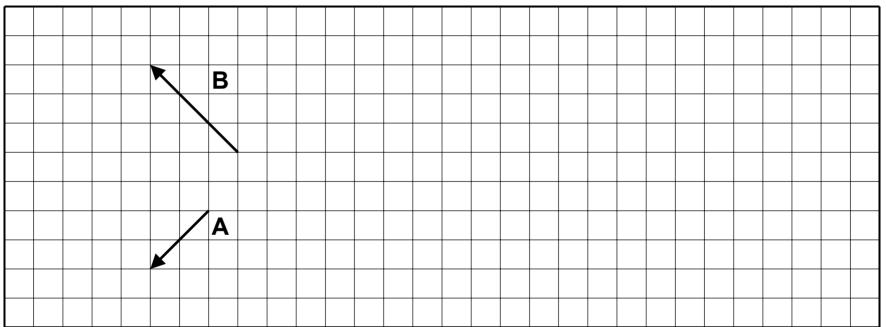

Most common error: choosing F <u>and</u> G

# Two Key Items

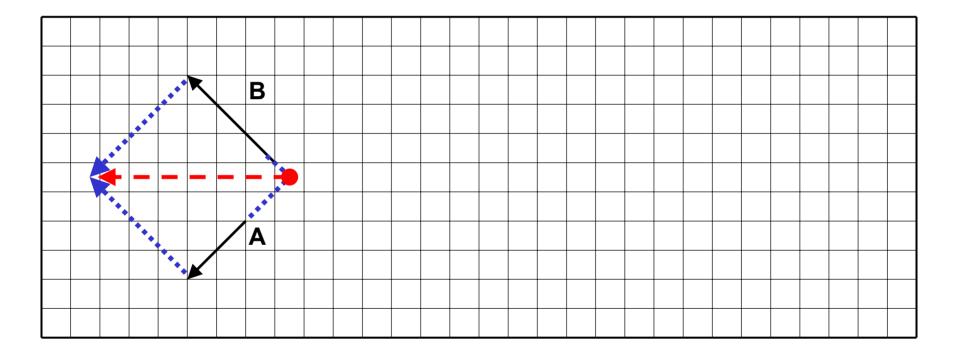

- Question #2: Choose vector with same direction as given vector
- Question #5: Two-dimensional vector addition

Error Rates:			
C-2: 27%	C-1: 42%		
A-2: 56%	A-1: 78%		

Common Error

### **Difficulties with Vector Concepts**

- Imprecise understanding of vector direction
- Vague notion of vector addition

"*R* should be a combination of *A* and *B* so I tried to put it between *A* and *B*"

 Confusion regarding parallel transport (must maintain magnitude *and* direction as vector "slides")

# Difficulties with Graphical Representation of Vectors

- **Dependence on grid:** many students were unable to add vectors without a grid
- Little gain: Relatively small gains resulting from first-semester instruction

### Investigation of Physics Learning with Diverse Representations (with T. Greenbowe and L. Allen)

- Probe student understanding of standard physics representations
- Compare student reasoning with different forms of representation

### "Multiple-Representation" Quiz

- Same or similar question asked in more than one form of representation
  - e.g., verbal [words only], diagrammatic, mathematical, etc.
- Comparison of responses yields information on students' reasoning patterns with diverse representations

### Example: Quiz on Gravitation

- 11-item quiz given on second day of class in Physics 112 (second-semester, algebra-based general physics)
  - all students have completed study of mechanics
- Two questions on quiz relate to Newton's third law in astronomical context
  - verbal version and diagrammatic version

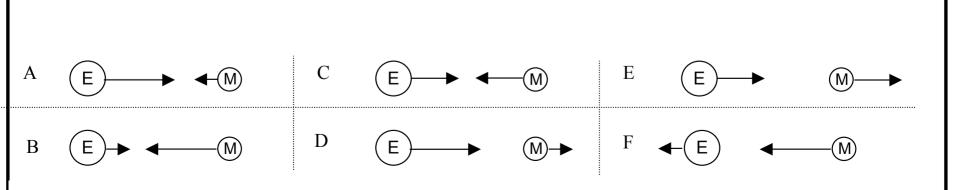

The force exerted by the sun on the earth is:

- A. about 9 x 10<sup>10</sup> times larger
- B. about 3 x 10<sup>5</sup> times larger
- C. exactly the same
- D. about 3 x 10<sup>5</sup> times smaller
- E. about 9 x 10<sup>10</sup> times smaller

The force exerted by the sun on the earth is:

- A. about 9 x 10<sup>10</sup> times larger
- B. about 3 x 10<sup>5</sup> times larger
- C. exactly the same
- D. about 3 x 10<sup>5</sup> times smaller
- E. about 9 x 10<sup>10</sup> times smaller

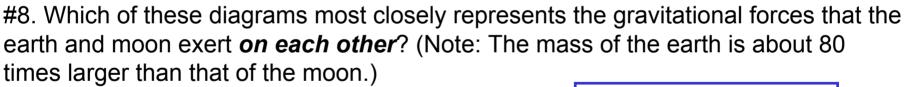

#8. Which of these diagrams most closely represents the gravitational forces that the earth and moon exert **on each other**? (Note: The mass of the earth is about 80 times larger than that of the moon.)

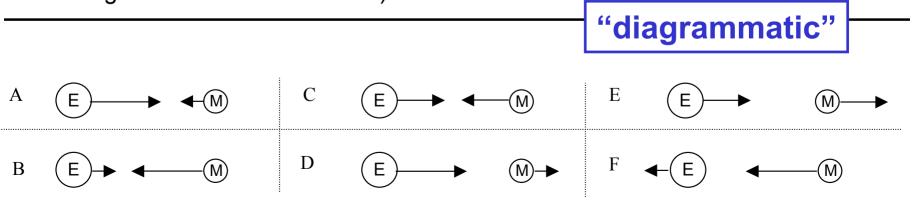

"verbal

The force exerted by the sun on the earth is:

- A. about 9 x 10<sup>10</sup> times larger
- B. about 3 x 10<sup>5</sup> times larger
- C. exactly the same
- D. about 3 x 10<sup>5</sup> times smaller
- E. about 9 x 10<sup>10</sup> times smaller

#8. Which of these diagrams most closely represents the gravitational forces that the earth and moon exert **on each other**? (Note: The mass of the earth is about 80 times larger than that of the moon.)

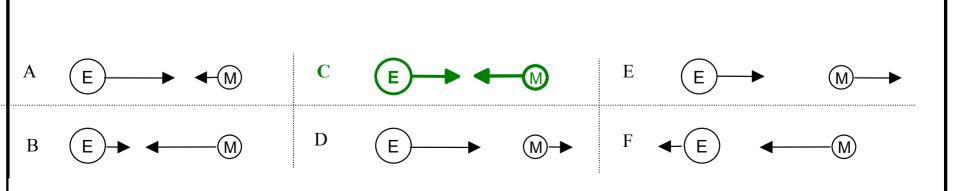

The force exerted by the sun on the earth is:

- A. about 9 x 10<sup>10</sup> times larger
- B. about 3 x 10<sup>5</sup> times larger

#### C. exactly the same

- D. about 3 x 10<sup>5</sup> times smaller
- E. about 9 x 10<sup>10</sup> times smaller

#8. Which of these diagrams most closely represents the gravitational forces that the earth and moon exert **on each other**? (Note: The mass of the earth is about 80 times larger than that of the moon.)

The force exerted by the sun on the earth is:

- A. about 9 x 10<sup>10</sup> times larger
- B. about 3 x 10<sup>5</sup> times larger

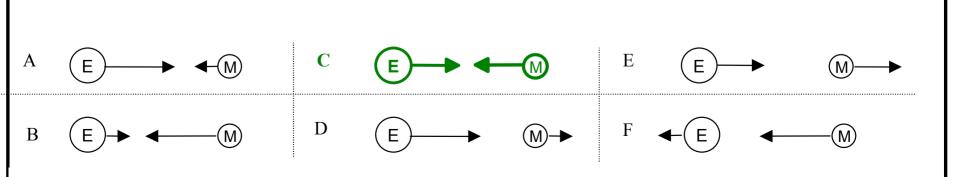

#### C. exactly the same

- D. about 3 x 10<sup>5</sup> times smaller
- E. about 9 x 10<sup>10</sup> times smaller

### Comparison of Responses

- Proportion of correct responses on diagrammatic version of question is consistently lower than on verbal version.
- Pattern of incorrect responses is dramatically different on two versions of question:
  - most common response on verbal version: force exerted by more massive object has larger magnitude
  - on diagrammatic version: force exerted by more massive <u>or</u> less massive object has larger magnitude

# Comparison of Responses: Diagrammatic vs. Verbal

Appa phra

Apparently many students have difficulty translating phrase "*exerted on*" into vector diagram form.

### Coulomb's Law Quiz in Multiple Representations

#### IF YOU WANT A QUESTION GRADED OUT OF THREE POINTS (-1 [<u>MINUS ONE</u>] FOR WRONG ANSWER!!) WRITE "3" IN SPACE PROVIDED ON EACH QUESTION.

- When two identical, isolated charges are separated by two centimeters, the magnitude of the force exerted by each charge on the other is eight newtons. If the charges are moved to a separation of eight centimeters, what will be the magnitude of that force now?
- A. one-half of a newton
- B. two newtons
- C. eight newtons
- D. thirty-two newtons
- E. one hundred twenty-eight newtons

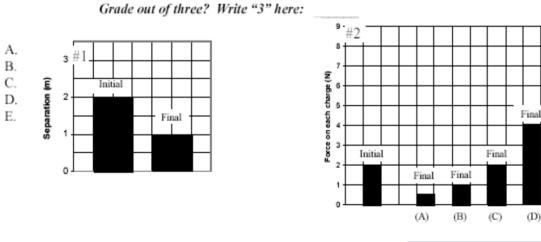

Grade out of three? Write "3" here:

2. Figure #1 shows two identical, isolated charges separated by a certain distance. The arrows indicate the forces exerted by each charge on the other. The same charges are shown in Figure #2. Which diagram in Figure #2 would be correct?

- 3. Isolated charges  $q_1$  and  $q_2$  are separated by distance r, and each exerts force F on the other.  $q_1^{initial} = q_1^{final}$  and  $q_2^{initial} = q_2^{final}$ ;  $r^{initial} = 10m$ ;  $r^{final} = 2m$ .  $F^{initial} = 25N$ ;  $F^{final} = ?$
- A. 1 N
- B. 5 N
- C. 25 N
- Grade out of three? Write "3" here: D. 125 N
- E. 625 N
- 4. Graph #1 refers to the initial and final separation between two identical, isolated charges. Graph #2 refers to the initial and final forces exerted by each charge on the other. Which bar is correct?

(D)

(E)

Final

# Outline

• Overview of goals and methods of PER

Investigation of Students' Reasoning:

- Students' reasoning in thermodynamics
- Diverse representational modes in student learning

### **Curriculum Development:**

 Instructional methods and curricular materials for largeenrollment physics classes

### Assessment of Instruction:

- Measurement of learning gain
- Potential broader impact of PER on undergraduate education

### Active Learning in Large Classes

- "Active Learning Problem Sheets" (A. Van Heuvelen): worksheets for in-class use, emphasizing multiple representations
- *"Interactive Lecture Demonstrations"* (R. Thornton and D. Sokoloff): students make written predictions of outcomes of demonstrations.
- *"Peer Instruction"* (Eric Mazur): lecture segments interspersed with challenging conceptual questions; students discuss with each other and communicate responses to instructor.
- *"Fully Interactive" Lecture* (D. Meltzer and K. Manivannan): multi-question sequences with instantaneous student response, combined with free-response worksheets.

"Fully Interactive" Physics Lecture DEM and K. Manivannan, Am. J. Phys. 70, 639 (2002)

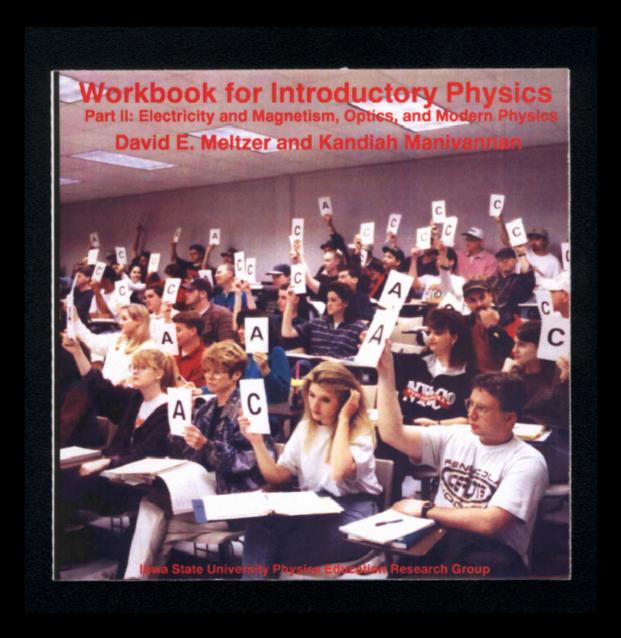

- Very high levels of student-student and studentinstructor interaction
- Simulate one-on-one dialogue of instructor's office
- Use numerous structured question sequences, focused on specific concept: small conceptual "step size"
- Use student response system to obtain instantaneous responses from all students simultaneously (e.g., "flash cards")

### Curriculum Requirements for Fully Interactive Lecture

- Many question sequences employing multiple representations, covering full range of topics
- Free-response worksheets adaptable for use in lecture hall
- Text reference ("Lecture Notes") with strong focus on conceptual and qualitative questions

Workbook for Introductory Physics (DEM and K. Manivannan, CD-ROM, 2002)

#### Part 4: Additional Worksheets

Chapter 1: Experiments with Sticky Tape Chapter 2: Electric Fields Chapters 6 & 8: More Experiments with Electric Circuits Chapter 7: Electric Power, Energy Changes in Circuits Chapter 8: Circuits Worksheet Chapter 9: Investigating the Force on a Current-Carrying Wire Chapter 9: Magnetism Worksheet Chapter 9: Magnetic Force Chapter 9: Torque on a Current Loop in a Magnetic Field Chapter 10: Magnetic Induction Activity Chapter 10: Magnetic Induction Worksheet Chapter 10: Motional EMF Worksheet Chapter 9-10: Homework on Magnetism Chapter 11: Electromagnetic Waves Worksheet Chapter 12: Optics Worksheet Chapter 13: Atomic Physics Worksheet Chapter 14: Nuclear Physics Worksheet

Part 5: Quizzes

Part 6: Exams and Answers

#### Part 7: Additional Material

#### Part 8: "How-to" Articles

Promoting Interactivity in Lecture Classes Enhancing Active Learning The Fully Interactive Physics Lecture

#### Part 9: Flash-Card Masters

Part 10: Video of Class video

#### AUTHORS:

David E. Meltzer: Department of Physics and Astronomy, Iowa State University, Ames, IA 50011 dem@iastate.edu

Kandiah Manivannan: Department of Physics, Astronomy, and Materials Science, Southwest Missouri State University, Springfield, MO 65804 kam319f@smsu.edu

### Curriculum Development on the Fast Track

- Need curricular materials for complete course
   ⇒ must create, test, and revise "on the fly"
- Daily feedback through in-class use aids assessment
- Pre- and post-testing with standardized diagnostics helps monitor progress

### **Components of Workbook**

- Multiple-choice "flash-card" questions
- Free-response worksheets
- Lecture Notes (text reference)
- Quizzes and Exams

#### Chapter 1 Electrical Forces

#### In-Class Questions

Prerequisite Concepts:

- Positive and negative charges; Coulomb's law:  $F = kq_1q_2/r^2$
- · Protons (+) and electrons (-)
- Superposition principle: F<sub>net</sub>=F<sub>1</sub>+F<sub>2</sub> + . . . + F<sub>n</sub>
- Vector addition: F<sub>netx</sub>=F<sub>1x</sub> + F<sub>2x</sub> + . . . F<sub>nx</sub>
- Newton's second law, a = F/m

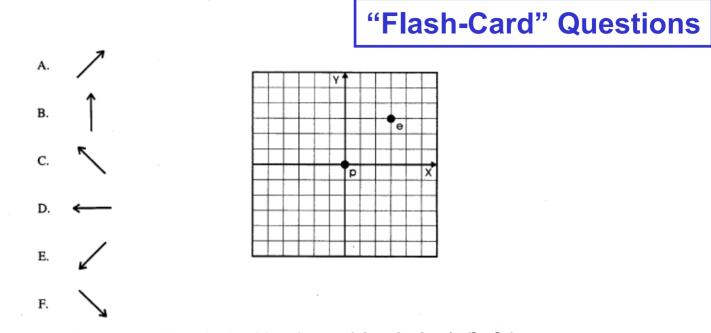

Questions #1-2 refer to the figure below. Charge  $q_1$  is located at the origin, and charge  $q_2$  is located on the positive x axis, five meters from the origin. There are no other charges anywhere nearby.

YŤ	
	t
q,	<b>q</b> <sub>2</sub>
T	TX.

- 1. If q<sub>1</sub> is positive and q<sub>2</sub> is negative, what is the direction of the electrical force on q<sub>1</sub>?
  - A. in the positive x direction
  - B. in the negative x direction
  - C. in the positive y direction
  - D. in the negative y direction
  - E. the force is not directed precisely along any of the coordinate axes, but at some angle
  - F. there is no force in this case
- 2. If  $q_1$  is positive and  $q_2$  is positive, what is the direction of the electrical force on  $q_1$ ?
  - A. in the positive x direction
  - B. in the negative x direction
  - C. in the positive y direction
  - D. in the negative y direction
  - E. the force is not directed precisely along any of the coordinate axes, but at some angle
  - F. there is no force in this case

#### **"Flash-Card" Questions**

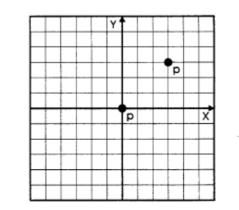

3. In this figure, a proton is located at the origin, and an electron is located at the point (3m, 3m). What is the direction of the electrical force on the proton?

4. In this figure, a proton is located at the origin, and a proton is located at the point (3m, 3m). The vector representing the electrical force on the proton *at the origin* makes what angle with respect to the positive x axis?

A. 0°B. 45°

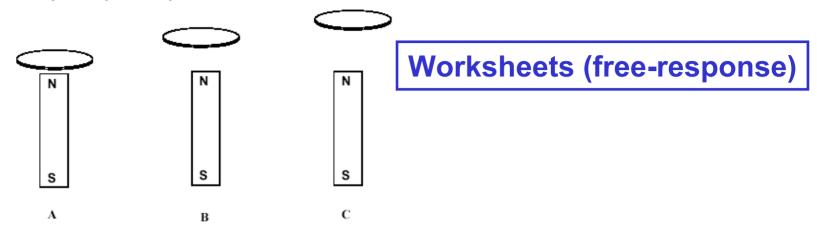

C. 90°
D. 135°
E. 225°
F. 270°

2

#### Magnetic Induction Worksheet

 In diagrams A, B, and C, three identical bar magnets and three identical wire loops are shown. All three loops remain fixed in the positions shown.

a) Is there any magnetic flux in:

Loop A?

Loop B?

Loop C?

b) Rank the magnitude of the magnetic flux in loops A, B, and C. If all three are zero, state that explicitly. Explain your answer.

c) Is there any current flowing in:

Loop A? \_\_\_\_\_

Loop B?

Loop C?

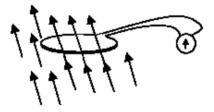

d) Rank the magnitude of the current flowing in loops A, B, and C. If all three currents are zero, state that explicitly. Explain your answer.

#### Chapter 10 Notes: Magnetic Induction

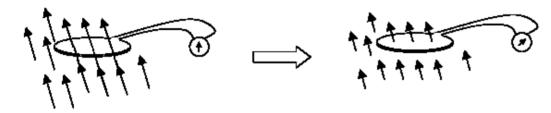

#### How can a changing magnetic field cause an electric current to flow?

Eleven years after the connection between magnetism and electricity was first reported by Oersted, the British scientist Michael Faraday made one of the most important discoveries in the history of physics. Oersted had found that an electric current could influence the motion of a compass needle; this showed that an electric current produced a magnetic field. Faraday found that, under certain specific circumstance, a magnet (such as a large compass needle) could itself *produce* an electric current (i.e., it could cause charges to begin to move). Although an electric current *abways* produces a magnetic field, Faraday found that a magnet could only produce an electric current under one or more of three basic conditions: (1) the magnetic field varied in *magnitude*; (2) the magnetic field varied in *direction*; (3) the conducting path (which would carry the current) *varied in shape*.

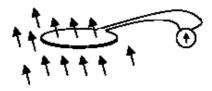

These situations can be illustrated by three different experiments, all involving a magnetic field and a closed loop of conducting material. We could connect a galvanometer (a current-detecting device) to the loop to determine whether or not a current is flowing. We could use a permanent magnet to produce the magnetic field, or instead use the uniform field inside a solenoid. In the diagram below, we have placed a conducting loop in a uniform magnetic field (indicted by the arrows); the loop is connected to a galvanometer. The needle of the galvanometer will deflect (move away from its initial position) if a current if produced in the loop. If the needle is in its initial position (as shown here), there is *no* current flowing in the loop.

In the *initial* situation shown above, where neither the loop nor the magnetic field is changing in any way, *no current* is observed to flow in the loop. However, if we *change the magnitude* of the magnetic field – either an increase or a decrease – then a current *does* flow in the loop, as shown here:

However, if the magnetic field magnitude *stops changing*, the current will abruptly cease flowing and the galvanometer needle will go back to its initial position (again indicating "zero current"):

## **Assessment Data**

Scores on Conceptual Survey of Electricity and Magnetism, 14-item electricity subset

Sample	N	
National sample (algebra-based)	402	
National sample (calculus-based)	1496	

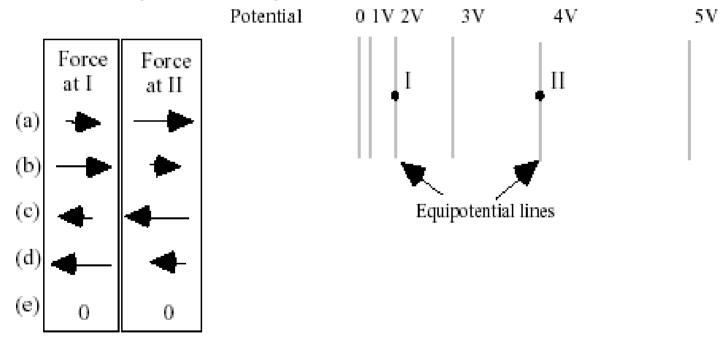

In the figures below, the dotted lines show the equipotential lines of electric fields. (A charge moving along a line of equal potential would have a constant electric potential energy.) A charged object is moved directly from point A to point B. The charge on the object is  $+1 \ \mu$ C.

1. How does the magnitude of the electric field at B compare for these three cases?

(a)	I > III > II	
(b) –	I > II > III	D. Maloney, T. O'Kuma, C. Hieggelke,
(c)	III > I > II	
(c) (d)	II > I > III	and A. Van Heuvelen, PERS of Am. J. Phys.
(e)	I = II = III	<b>69</b> , S12 (2001).

2. A positively-charged proton is first placed at rest at position I and then later at position II in a region whose electric potential (voltage) is described by the equipotential lines. Which set of arrows on the left below best describes the relative magnitudes and directions of the electric force exerted on the proton when at position I or II?

# Outline

• Overview of goals and methods of PER

Investigation of Students' Reasoning:

- Students' reasoning in thermodynamics
- Diverse representational modes in student learning

#### Curriculum Development:

 Instructional methods and curricular materials for largeenrollment physics classes

#### **Assessment of Instruction:**

- Measurement of learning gain
- Potential broader impact of PER on undergraduate education

## Measures of Learning Gain

- Single exam measures only instantaneous knowledge state, but instructors are interested in improving *learning*, i.e., transitions between states.
- Need a measure of learning gain that has maximum dependence on *instruction*, and minimum dependence on students' *pre-instruction* state.
- ⇒ search for measure that is correlated with instructional activities, but has minimum correlation with pretest scores.

### Normalized Learning Gain "g" R. R. Hake, Am. J. Phys. 66, 64 (1998)

$a = \frac{posttest \ score - pretest \ score}{posttest \ score}$	gain	
$g \equiv \frac{1}{maximum possible score - pretest score}$	maximum possible gain	

In a study of 62 mechanics courses enrolling over 6500 students, Hake found that mean normalized gain < g > on the Force Concept Inventory is:

- virtually independent of class mean pretest score (r = +0.02);
- = 0.23±0.04(s.d.) for traditional instruction, nearly independent of instructor;
- =0.48±0.14(s.d.) for courses employing "interactive engagement" active-learning instruction.

These findings have been largely confirmed in hundreds of physics courses worldwide

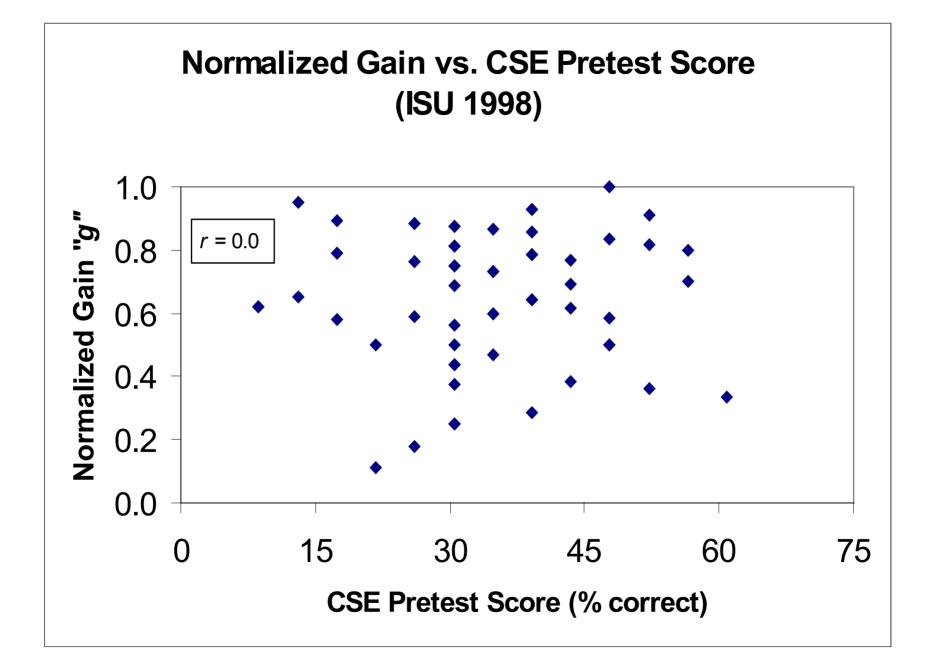

## But is g really independent of preinstruction state?

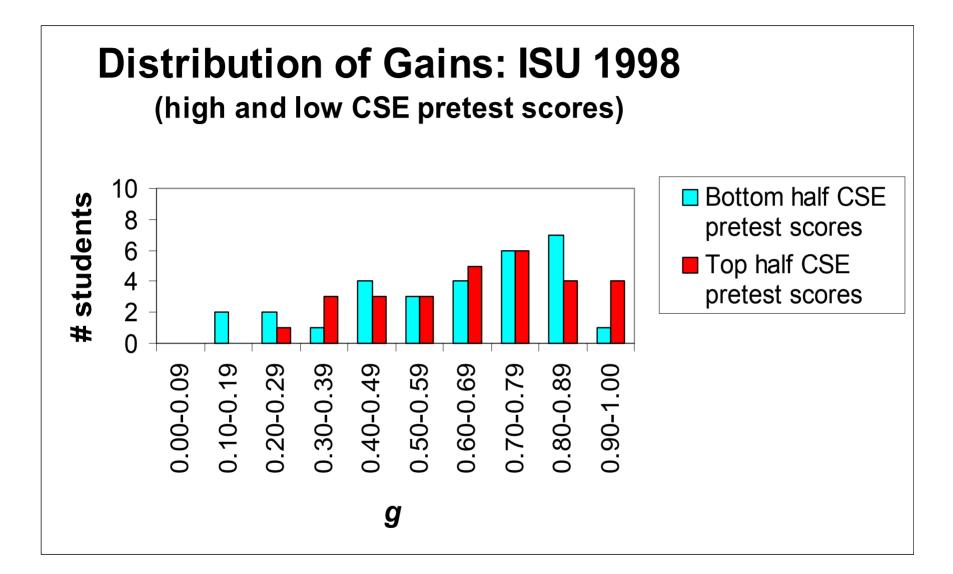

Possible "hidden variables" in students' preinstruction mental state:

- mathematical skill *R. Hake et al.,* 1994; *M. Thoresen and C. Gross, 2000; DEM, PERS of AJP (in press)*
- spatial visualization ability R. Hake 2002
- **Gender** L. McCullough 2000; L. McCullough and DEM, Proc. of PER Conf. 2001, R. Hake 2002
- reasoning ability J. M. Clement, 2002

### Relationship between Mathematical Ability and Learning Gains in Physics DEM, Am. J. Phys. **70**, 1259 (2002)

- Investigation of four separate introductory E & M courses (algebra-based, second semester)
- No correlation between individual students' normalized learning gain g and their pre-instruction score on physics concept test (Conceptual Survey of Electricity, "CSE")

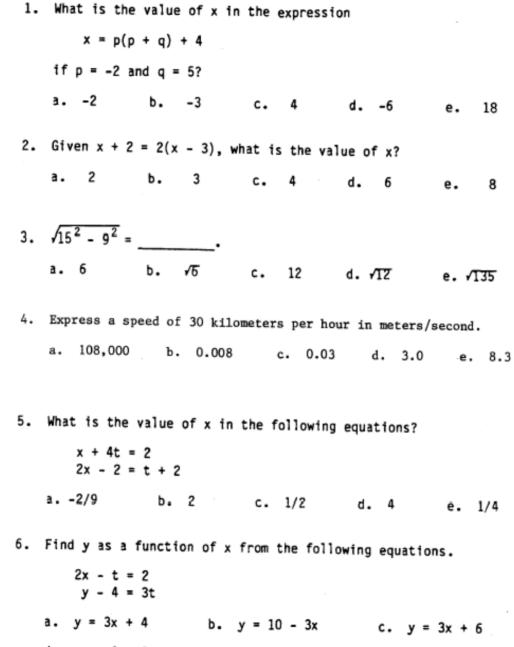

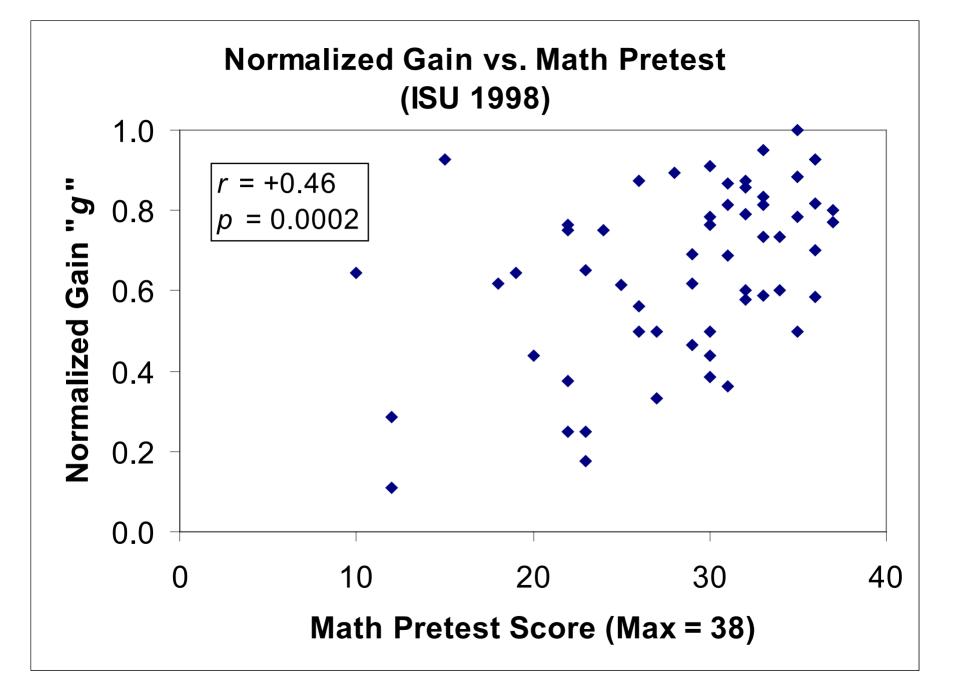

### Relationship between Mathematical Ability and Learning Gains in Physics DEM, Am. J. Phys. **70**, 1259 (2002)

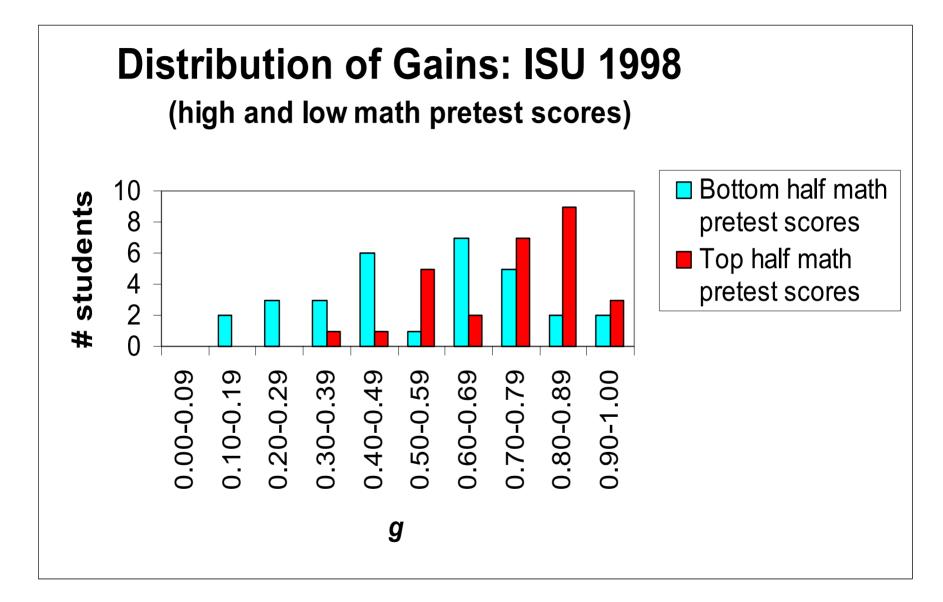

- Investigation of four separate introductory E & M courses (algebra-based, second semester)
- No correlation between individual students' normalized learning gain g and their pre-instruction score on physics concept test (Conceptual Survey of Electricity, "CSE")
- Significant correlation (r = +0.30 +0.46) between individual students' g and their pre-instruction score on algebra/trigonometry skills test (ACT Math Test and ISU Math Diagnostic)

#### DIAGNOSTIC TEST

d. y = 4 - 6x e. y = 6x - 2

## Second-Order Effects on *g*

- Normalized gain g not correlated with preinstruction physics knowledge
- Normalized gain g is correlated with preinstruction math skill
- When comparing *g* for diverse student populations, may need to take into account students' pre-instruction state

# Outline

• Overview of goals and methods of PER

Investigation of Students' Reasoning:

- Students' reasoning in thermodynamics
- Diverse representational modes in student learning

#### Curriculum Development:

 Instructional methods and curricular materials for largeenrollment physics classes

#### Assessment of Instruction:

- Measurement of learning gain
- Potential broader impact of PER on undergraduate education

## How Can PER be a Model for Improving Undergraduate Education?

Physicists bring a powerful set of tools to the task of analyzing and improving learning of their subject:

- Precision in definitions: operational definitions based
   on measurement procedures
- Search for fundamental determining factors
- Stress on identification and control of variables
- Familiarity with complex relationships (not everything is linear!)
- Controlling approximations through careful estimation

## Achievements of PER as a Field

- Sustained and systematic investigation of students' reasoning has yielded reliable and reproducible results.
- Research-based curriculum and instruction has documented learning improvements in specific areas.
- Growth and development of PER community is evidence for long-term viability of discipline-based educational research at the university level.

# Summary

 Investigation of students' reasoning lays the basis for improved curriculum

e.g. curricular materials in thermodynamics focused on difficulties with process-dependent quantities

• Probing deep-seated learning issues can lead toward more precise targeting of instruction

e.g., understanding students' difficulties with diverse representations of physical systems may lead to more effective instructional strategies

• Continual process of development and assessment of research-based curriculum holds promise for sustained improvements in learning.
